

Supplement C. Record Types

The IMMA *Core* (Table C0) forms the common front-end for all record types. By itself, the *Core*, which is divided into location and regular sections, forms a useful abbreviated record type incorporating many of the most commonly used data elements in standardized form (drawn from the fields to be agreed internationally, listed in Supp. D). Concatenating one or more “attachments” (attm) after the *Core* creates additional record types. At the time of Release 3.0 of ICOADS, in addition to the *Core*, the following attms have been defined:

Table C0: Core (<i>Core</i>)	(108 characters)
Table C1: ICOADS (<i>Icoads</i>) attm	(65 characters)
Table C5: IMMT-5/FM 13 (<i>Immt</i>) attm	(94 characters)
Table C6: Model quality control (<i>Mod-qc</i>) attm	(68 characters)
Table C7: Ship metadata (<i>Meta-vos</i>) attm	(58 characters)
Table C8: Near-surface oceanographic (<i>Nocn</i>) attm	(102 characters)
Table C9: Edited cloud report (<i>Ecr</i>) attm (see Annex E)	(32 characters)
Table C95: Reanalyses QC/feedback (<i>Rean-qc</i>) attm	(61 characters)
Table C96: ICOADS Value-added Database (<i>Ivad</i>) attm	(53 characters)
Table C97: Error (<i>Error</i>) attm	(32 characters)
Table C98: Unique report ID (<i>Uida</i>) attm	(15 characters)
Table C99: Supplemental data (<i>Suppl</i>) attm	(source-dep. length)

including three deprecated attms:

Table C2: IMMT-2/FM 13 attm	(76 characters)
Table C3: Model quality control attm	(66 characters)
Table C4: Ship metadata attm	(57 characters)

whose documentation can be found in <http://icoads.noaa.gov/e-doc/imma/R2.5-imma.pdf>.

Additionally, the following attms have been proposed (CP):

Table CP1: Automated instrumentation (<i>Auto</i>) attm	(41 characters)
Table CP2: Near-surface oceanographic QC (<i>Nocq</i>) attm	(28 characters)
Table CP3: Alternative QC (<i>Alt-qc</i>) attm	(proposed)
Table CP4: Platform tracking (<i>Track</i>) attm	(proposed)
Table CP5: Historical (<i>Hist</i>) attm	(proposed)

The proposed attms are discussed in Supp. F, but have not been implemented at the time of R3.0. In addition, the following attms are envisioned as further possibilities, but without any suggested content in Supp. F:

Buoy metadata (<i>Meta-buoy</i>) attm	(proposed, no table)
Daily observational (<i>Daily</i>) attm	(proposed, no table)

Throughout Supp. C, each table contains these columns:

- 1 Field number (No.). Field numbering is attm-internal beginning with field number 1 and ending with the last field indicated in each table.

- 2 Length (Len.) in characters (i.e., 8-bit bytes⁷).
- 3,4 Abbreviation (Abbr.) for each element (or field), and a brief Element Description.
- 5,6 For fields with a bounded numeric range (either decimal or base36), the minimum (Scaled Min.) and maximum (Scaled Max.) are indicated in decimal (and/or in base36 in [square brackets]). When values are provided for Scaled Min./Max., they represent the field value multiplied by the numeric part of the Units field (if applicable). In other cases the range and configuration are listed as: “a” for alphabetic (A-Z), “b” for alphanumeric (strictly 0-Z with no leading blanks), “c” for alphanumeric plus other printable characters, or “u” for undecided form (only for fields that are currently unused). Base36 fields include “[b36]” in the Units column, and, as for decimal numeric fields, any leading missing positions are blank (vs. zero) filled (note: as a consequence, base36 is not always interpretable as alphanumeric). For Base36 encoded fields both the numeric range and Base36 range (in []) are listed for the Scaled Min./Max.

Base36 encoding showing decimal numbers and base36 equivalent values (reproduced from Table 1 in main text above). The complete set of 1-character encodings (0-35) is listed on the left, and examples of 2-character encodings (0-1295) are given on the right. Note that the subset 0-F of base36 is the same as hexadecimal.

1-character encoding:								E.g., 2-character	
encoding:									
<u>dec.</u>	<u>base36</u>	<u>dec.</u>	<u>base36</u>	<u>dec.</u>	<u>base36</u>	<u>dec.</u>	<u>base36</u>	<u>dec.</u>	<u>base36</u>
0	0	10	A	20	K	30	U	0	0
1	1	11	B	21	L	31	V	1	1
2	2	12	C	22	M	32	W	2	2
3	3	13	D	23	N	33	X	.	.
4	4	14	E	24	O	34	Y	.	.
5	5	15	F	25	P	35	Z	.	.
6	6	16	G	26	Q			1293	ZX
7	7	17	H	27	R			1294	ZY
8	8	18	I	28	S			1295	ZZ
9	9	19	J	29	T				

- 7 Units of data and related WMO codes. Information in parentheses usually relates the IMMA field to a field from Supp. B, Table B2 (if applicable): WMO code symbolic letters are listed, or “•” followed by a field number from Table B2 in the absence of symbolic letters. This information is prefixed by “Δ” to highlight field configurations that are extended in range or modified in form from presently defined WMO representations.

Table C0. IMMA Core.

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code) [base36]</u>

43	2	WD	wave direction	0	38	
44	2	WP	wave period	0	30, 99	seconds (P _W P _W)
45	2	WH	wave height	0	99	(H _W H _W)
46	2	SD	swell direction	0	38	(d _{W1} d _{W1})
47	2	SP	swell period	0	30, 99	seconds (P _{W1} P _{W1})
48	2	SH	swell height	0	99	(H _{W1} H _{W1})

1. Fields differing from the ICOADS-standard representation in the obsolete NCDC-variant format (see Supps. D-E for further details). For *MO*, *DY*, and *HR*, the NCDC-variant format used leading zeros as an exception to the “blank left-fill” aspect of the ICOADS-standard representation for numeric data.

Table C1. ICOADS (*Icoads*) attm.

35-48	1×14	ZNC-	NCDC-QC flags	1 [1]	10 [E]	(14 flags) ² [b36]

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code) [base36]</u>
		<i>TNC</i> ¹				
49	2	<i>QCE</i> ³	external (e.g., MEDS)	0	63	integer encoding (6 flags)
50	1	<i>LZ</i>	2°x2° landlocked flag	1	1	
51	2	<i>QCZ</i> ³	source exclusion flags	0	31	integer encoding (5 flags)

1. A set of flags (elaborated briefly here and in Table C1a; see *R3.0-stat_trim* [in preparation] for detailed information) is stored in each of these element lengths. The first letter of each such QC flag indicates the applicable fields(s) (or if the QC applies to an entire report), according to the following general scheme (referring, except as noted, to field abbreviations from Table C0): *A*=AT, *B*=VV, *C*=clouds⁴ (*N*, ..., *CH*), *D*=DPT, *E*=wave, *F*=swell, *G*=WBT, *P*=SLP, *R*=humidity variables (relative humidity, *DPT*, and/or *WBT*, depending on QC scheme), *S*=SST, *T*=A and *PPP*, *U* or *V*=wind U- or V-component (monthly summary variables not in Table C0), *W*=wind, *X*=WW, *Y*=W1, *Z*=entire report. The lists of flag abbreviations are then:

- Adaptive QC flags: *SQZ*, *SQA*, *AQZ*, *AQA*, *UQZ*, *UQA*, *VQZ*, *VQA*, *PQZ*, *PQA*, *DQZ*, *DQA* (two flags × 12 variables).
- Trimming flags: *SF*, *AF*, *UF*, *VF*, *PF*, *RF* (one flag × six variables).
- NCDC-QC flags: *ZNC*, *WNC*, *BNC*, *XNC*, *YNC*, *PNC*, *ANC*, *GNC*, *DNC*, *SNC*, *CNC*, *ENC*, *FNC*, *TNC* (one flag × 14 variables).

2. *R3.0-stat_trim* [in preparation] provides further information about how to convert the coded (base36) values stored in these flags into true (floating-point) values (handled automatically by {rwimma1}).

3. Handled as a single element by {rwimma1}, but actually holds a set of flags (elaborated as follows, and in Table C1a), which must be decoded separately. Using the 1st-letter naming scheme described in the first footnote, the abbreviations for the flags stored in *QCE* are: *ZE*, *SE*, *AE*, *WE*, *PE*, *RE*; and those stored in *QCZ* are: *SZ*, *AZ*, *WZ*, *PZ*, *RZ*. Flag *RE*, presently unused, has been set aside for possible future use. *R3.0-stat_trim* [in preparation] provides further information about how to decode the information stored within *QCE* and *QCZ*.

4. Further details on the NCDC-QC (e.g., noting which parameters are considered in the cloud group) can be found in *Release 1*, supp. J (http://icoads.noaa.gov/Release_1/suppJ.html).

Table C1a lists the QC elements available (some presently obsolete or unused, as noted) as part of the *Icoads* atm.

Table C1a. QC elements within the *Icoads* atm (fields 1-15 of that atm are described in Table C1). Grey shaded flags presently are unused.

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code)</u>
QC elements (38 characters):

62	4	RH	relative humidity	0.0	100.0	0.1%
63	1	RHI	relative humidity indic.	0	4	(RHi)
64	1	AWSI	AWS indicator	0	2	(AWSi)
65	7	IMONO	IMO number	0	9999999	(IMOno)

1. Zero is documented to mean "no movement," but has been suggested should not be used (see Supp. D).
2. Special code 362 for "variable, or all directions" is allocated in IMMA, but IMMT does not presently contain a corresponding configuration for RWS (see Supp. D).
3. As from IMMT-4 and IMMT-5, usage of Q₂₆ is discontinued, see Table B3 and IMMT-5 documentation (<https://www.wmo.int/pages/prog/amp/mmop/documents/IMMT-5-JCOMM-4.pdf>): "now Q₂₇ serves as the indicator for both S_L and HH."

Table C6. Model quality control (*Mod-qc*) atm. For reference, the Units column also includes (following any units information) the current UK Met Office BUFR element names.

15	1	ASIR	access status indic.— <i>Rean-qc</i>	0	1	0=active, 1=inactive

1. Determined *a priori* to be erroneous and is not used.

2. Determined *a priori* to be used regardless of assimilation assessment.

3. The range, numeric precision, and units of measurement are all inherited from *ICNR* & *FNR*, e.g., *ICNR*=0 and *FNR*=29 refer to *AT*, which can range from –99.9 to 99.9, with precision and units of 0.1°C. Thus feedbacks on *AT* stored in this attm in *MFGSR*, *MAR* and *BCR* have precision increased to 0.01°C, with range –99.99 to 99.99.

4. Optional field, used in the case of ensemble reanalyses.

5. Note: these ranges differ from those specified in other tables (e.g., –99.9 to 99.9 for *AT*) in that they represent scaled values (i.e., no decimal points are listed, if applicable).

6. *ARCR* as an optional field that is intended to point to a publication or technical report.

7. To be set by the external developer, as to when they produced the attm, ref.:

http://en.wikipedia.org/wiki/ISO_8601.

Table C96. ICOADS Value-Added Database (*lvad*) attm. Intended to store adjusted fields associated with *INC1* and *FNI*, whereas the unadjusted data will continue to be stored in the *Core*/other attms.

14	1	JVAU3	scaling factor for VAU3	0 [0]	35 [Z]	10^{JVAU3} ([b36]) ¹
15	6	VAU3	uncertainty of type IVAU3	–99999	999999	10^{-JVAU3} (units inherited) ²
16	1	VQC	value-added QC flag	1	4, 9	(see Supp D., Table C96a)
17	4	ARCI	author reference code— <i>lvad</i>	b	b	(alphanumeric)
18	8	CDI	creation date— <i>lvad</i>	20140101	2nnn1231	ISO-8601, YYYYMMDD (as for CDR, ref. Table C95)
19	1	ASII	access status indic.— <i>lvad</i>	0	1	0=active, 1=inactive

1. Scaling factor applied to convert “FVAD,” an input floating-point value, into VAD (i.e., representing also VAU1, VAU2, or VAU3) according to $VAD = FVAD \times 10^{JVAD}$. Then the original un-scaled value is reconstructed according to $FVAD = VAD \times 10^{-JVAD}$.

2. Only the units of measurement are inherited from ICNI & FNI (e.g., ICNI=0 and FNI=29 refer to AT, which has units of °C); the scaled range is as specified, and the numeric precision is determined (e.g., at run time by {rwimma1}) from the scaling factor (e.g., again taking the AT case: 0 = whole °C, 1 = 0.1°C, 2 = 0.01°C, etc.).

Table C97. Error (Error) attm. Designed to support correction of erroneous IMMA elements. Errors (e.g., callsign garbling) for a given ICNE and FNE will be stored by ICOADS in the Core/other attms, whereas uncorrected data will be stored in this Error attm—this is an inversion of the planned handling of data adjustments using the *lvad* attm.

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code) [base36]</u>
1	2	ATTI	attm ID			Note: set ATTI=97
2	2	ATTL	attm length			Note: set ATTL=32
Corrected erroneous data and metadata:						
3	2	ICNE	input component number— <i>Error</i>	0	99	IMMA component number
4	2	FNE	field number— <i>Error</i>	1	99	IMMA field no. within ICNE
5	1	CEF	corrected/erroneous field flag	0	1	0: <i>ERRD</i> is the corrected value; 1: <i>ERRD</i> is the erroneous value
6	10	ERRD	corrected/erroneous field value	c ¹	c ¹	(units & numeric precision inherited from ICNE & FNE)
7	4	ARCE	author reference code— <i>Error</i>	b	b	(alphanumeric)
8	8	CDE	creation date— <i>Error</i>	20140101	2nnn1231	ISO-8601, YYYYMMDD (as for CDR, ref. Table C95)

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code) [base36]</u>
9	1	ASIE	access status indic.— Track	0	1	0=active, 1=inactive

1. {rwimma1} initializes *ERRD Min.*, *Max.* to c c but these values are changed to (*inh.*) after *ICNE* and *FNE* are known; fields are right-justified, e.g., *ID* is left-justified in *ERRD* characters two through ten.

Table C98. Unique report ID (*Uida*) atm.

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Scaled Min.</u>	<u>Scaled Max.</u>	<u>Units (Code) [base36]</u>
1	2	ATTI	atm ID			Note: set ATTI=98
2	2	ATTL	atm length			Note: set ATTL=15
Processing elements (10 characters):						
3	6	UID	unique report ID	b	b	(alphanumeric ¹)
4	1	RN1	Release no.: primary	0 [0]	35 [Z]	e.g., 2 [b36]
5	1	RN2	Release no.: secondary	0 [0]	35 [Z]	e.g., 5 [b36]
6	1	RN3	Release no.: tertiary	0 [0]	35 [Z]	e.g., 0 (thus 2.5.0 together) [b36]
7	1	RSA	Release status indicator	0	2	0=Prelim., 1=Aux., 2=Full
8	1	IRF	intermediate reject flag	0	2	0=Retain in Intermediate, Reject from Final, dataset; 1=Retain in both Intermediate and Final datasets; 2=Reject from both Intermediate and Final datasets

1. While it represents a base36 number, this field is handled by {rwimma1} as strictly (i.e., without leading spaces, e.g., 35=00000Z) alphanumeric, and thus is not fully translated into an integer or floating-point (REAL) number (ref. {rwimma1} comments: "For character [...] fields, note that ITRUE and FTRUE contain the ICHAR of the first character of the field..."). Separate from {rwimma1} however, this Fortran library is available to transform *UID* into an integer (and vice versa): <http://icoads.noaa.gov/software/base36.f>. Users interested in handling *UID* as a number should be aware of possible finite precision issues arising in the representation of large numbers on computers:

- In the integer case, the largest 6-character base36 number is ZZZZZZ (2,176,782,335); however, if one bit is reserved for sign, the largest positive integer representable in 32 bits is only $2^{31}-1$ (2,147,483,647; ZIK0ZJ in base36). As noted below the current maximum of *UID* is $m_{R2.5f}$ (~295M) and thus well below this threshold.
- Whereas, in the floating-point case it is not even possible to accurately represent $m_{R2.5f}$ as a 32-bit single precision REAL number.

Table C99. Supplemental data (*Suppl*) attm. This attm stores the original input data string, with recommended settings *ATTL*=0 (unspecified length) and *ATTE*=missing (ASCII). For processing via {rwimma1}, this attm must appear at the end of the record, and the record must terminate with a line feed.

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	<i>ATTI</i>	attm ID			Note: set <i>ATTI</i> =99
2	2	<i>ATTL</i>	attm length			Note: set <i>ATTL</i> =0 ¹
3	1	<i>ATTE</i>	attm encoding	0	1	Note: set <i>ATTE</i> =missing ²
Supplemental data (format determined by data source):						
4		<i>SUPD</i> ¹	supplemental data	c	c	

1. The length of the supplemental data is unspecified if *ATTL*=0, and may be variable. Thus far, *ATTL* in bytes has not been supported in the read/write IMMA programs (e.g., {rwimma1}).

2. Thus far, *ATTE*=1 (hexadecimal) has been used only for MORMET (deck 732) data (to represent binary input). This printable representation, which {rwimma1} treats identically to ASCII, was undocumented in previously available (i.e., IMMA0) Suppl. D information. In addition, while the *ATTE*=0 (base64 encoding; unprintable) representation is documented in Suppl. D, currently it is unused and not fully implemented in {rwimma1}.

Supplement D. Field Configurations

This supplement provides configuration details for the individual fields listed in Supp. C. References to external information include the WMO *Manual on Codes* (2009a) and its Codes and Regulations governing e.g., the SHIP (FM 13) GTS code. Background notes indented below field descriptions provide additional usage or technical information, e.g., comparing field configurations with other formats, such as IMMT (Supp. B), COADS *Release 1* (Slutz et al. 1985), or LMR (<http://icoads.noaa.gov/e-doc/lmr>). Further detailed technical notes related more specifically to ICOADS, and to its current Release 3.0 (R3.0; Freeman et al. 2016) appear enclosed in [square brackets].

The IMMA field abbreviations are simple alphabetic strings (plus in some cases numeric suffixes), based generally on GTS (or IMMT) symbolic letters (if defined) but without subscripts. These are listed in *UPPER-CASE*, for broad computer portability. As discussed in Supp. A, symbolic abbreviations already provide an important means of communication about the fields and data among Member countries and end-users. However, a transition away from subscripts is recommended to facilitate computerized implementation (e.g., headings for listings of the data).

The configurations of numeric fields were developed on the basis of representations readily input and output by computer software. Fields are right justified within the specified field-widths (Supp. C), and to reduce data-volume decimal points are implicit (e.g., -99.9 is represented as -999). For signed numeric data, the plus sign (“+”) is omitted, and the minus sign (“-”) immediately prefixes the numeric portion (i.e., blank left-fill⁸). These conventions have the advantage that numeric data can be readily input without separate steps to handle IMM sign positions (0=positive, 1=negative), and without parsing to ensure that a field does not contain non-numeric characters (e.g., “/”).

In a delimited format, a universal missing value (e.g., -9999.99) could be selected outside the range of all data (except possibly for alphanumeric fields). In contrast, the fixed-field IMMA format contains different field-widths so a single numeric value is unworkable. A convention such as all nines filling each indicated field width also is impractical, e.g., because many of the 1-character fields have extant numeric values covering the range 0-9.

Therefore, blanks are used in IMMA as the universal representation for missing data. However, it is important to note that Fortran for example considers blanks (by default) to be equivalent to zero, thus to ensure correctness the processing must first parse a field as characters to ensure that it is not entirely blank. Machine-transportable Fortran software to help read (and optionally write) the IMMA data (“rwimma1”) is available (<http://icoads.noaa.gov/software/>).

Field configurations for proposed IMMA attms (e.g., for the historical attm) are undecided, and will benefit from future feedback and discussion (including possible alternative implementation options noted as part of the background information for some fields). In other cases existing (originally LMR-based) configurations have been utilized.

⁸ As an exception, the (obsolete) NCDC-variant record uses leading zeros in fields *MO*, *DY*, and *HR*. Additional differences between the NCDC-variant record and the ICOADS-standard record are described in Supp. E.

These provisional configurations are outlined in Supp. F and may warrant modification or expansion after international consideration.

Core (C0)

Location section

- | | | |
|--------------|------------------|---|
| 1) <u>YR</u> | <u>year UTC</u> | (four digits) |
| 2) <u>MO</u> | <u>month UTC</u> | (1=January, 2=February, ..., 12=December) |
| 3) <u>DY</u> | <u>day UTC</u> | (1-31) |
| 4) <u>HR</u> | <u>hour UTC</u> | (0.00 to 23.99) ⁹ |

Background: As for IMMT-5 except *HR*. In the NCDC-variant record, no longer produced (as well as in IMMT-5), *MO*, *DY*, and *HR* will include leading zero-fill, as applicable (e.g., 01=January). VOS data typically are reported to nearest whole hour, but the extended resolution is needed, e.g., for storage of drifting buoy data. For VOS data, WMO (2015) Reg. 12.1.6 states: "The actual time of observation shall be the time at which the barometer is read."

- | | |
|---------------|------------------|
| 5) <u>LAT</u> | <u>latitude</u> |
| 6) <u>LON</u> | <u>longitude</u> |

Position to hundredths of a degree +N or –S (measured north or south of the equator) and +E or –W (measured east or west of the Greenwich Meridian). The longitude range (–179.99° to 359.99°) specified in Supp. C (Table C0) encompasses two distinct longitude conventions: 0° to 359.99° (i.e., 0°E, 0.01°E, ..., 359.98°E, 359.99°E; ICOADS convention) and –179.99° to 180.00° (i.e., 179.99°W, 179.98°W, ..., 179.99°E, 180.00°E; NCDC-variant convention, now obsolete).

Background: The two longitude conventions are desirable for different applications and archival requirements. However 0° to 359.99° is generally recommended, because it is the simplest formulation and thus helps reduce the likelihood of location errors. Extended resolutions are needed in comparison to the IMMT-5 format, e.g., for drifting buoy data. Disallowing 360.00 and –180.00° ensures that meridians are uniquely represented within the convention range (i.e., avoiding: 0°/360.00°; 180.00°/–180.00°). However, even if IMMA records are stored in a mixture of these conventions, all longitude values can be accurately interpreted because the overall range for longitude reserves negative for the western hemisphere. Organizing *YR*, *MO*, *DY*, *HR*, *LAT*, and *LON* in sequence can facilitate synoptic sort operations. Characters (N, S, E, W) could alternatively have been used in place of sign for both *LAT* and *LON*, but this complicates computer processing and therefore was deemed not advisable, as was usage of conventions for quadrant (WMO Code 3333 as used in IMMT-5) or octant numbers (WMO 2015 notes under Code 3333 how the choice of quadrant is left to the observer under specific circumstances such as along the Equator).

- | | |
|--------------|--|
| 7) <u>IM</u> | <u>IMMA version</u> |
| | 0 – version 0 (2010, http://icoads.noaa.gov/e-doc/imma/R2.5-imma.pdf) |
| | 1 – version 1 (the current version, 2016, this document) |
| | 2 – version 2 |

⁹ Throughout Supp. D, floating-point ranges, if applicable, are provided as values would appear after applying the units scaling from the appropriate table in Supp. C to the integer values stored in the IMMA format.

etc.

8) ATTC attm count

ATTC provides the attm count:

0 – abbreviated record (no attm)

1 – one attm

2 – two attms

etc.

Background: *IM* and *ATTC* are positioned near the front of the record to allow computerized input and interpretation (e.g., of different IMMA versions), but after *LON* so as not to interfere with sort operations. The configuration of *IM* is similar to the IMMT-5 field “IMMT version” with a valid range 0-99. For IMMA1, the range of *ATTC* is extended to 10 and the representation is now base36.

9) TI time indicator

10) LI latitude/longitude indicator

TI preserves the incoming precision of time fields:

0 – nearest whole hour

1 – hour to tenths

2 – hour plus minutes

3 – high resolution (e.g., hour to hundredths)

LI preserves the precision at which *LAT* and *LON* were recorded or translated from, or if they were derived later by interpolation between known positions:

0 – degrees and tenths

1 – whole degrees

2 – mixed precision

3 – interpolated

4 – degrees and minutes

5 – high resolution data (e.g., degrees to seconds)

6 – other

Background: *TI* and *LI* match original LMR configurations, except that *LI*=2 was described there as “non random tenths” (a type of mixed precision; see *Release 1*, supp. F). [Note: No indication is available in *TI* for quasi-instantaneous vs. time-period averaged data (e.g., daily averages from PMEL deck 145).]

11) DS ship course

12) VS ship speed

WMO Code 0700 for true direction of resultant displacement of the ship during the three hours preceding the time of observation (i.e., ship’s course (true) made good):

0 – stationary (ship hove to) 5 – SW

1 – NE 6 – W

2 – E 7 – NW

3 – SE 8 – N

4 – S 9 – unknown

WMO Code 4451 for ship’s average speed made good during the three hours preceding the time of observation (beginning 1 January 1968):

0 – 0 knots 5 – 21-25 knots

1 – 1-5 knots 6 – 26-30 knots

2 – 6-10 knots 7 – 31-35 knots

3 – 11-15 knots 8 – 36-40 knots

4 – 16-20 knots 9 – over 40 knots

Prior to 1 January 1968 a different code for *VS*, also with range 0-9, applied (Met Office 1948):

- | | |
|-----------------|-------------------|
| 0 – 0 knots | 5 – 13-15 knots |
| 1 – 1-3 knots | 6 – 16-18 knots |
| 2 – 4-6 knots | 7 – 19-21 knots |
| 3 – 7-9 knots | 8 – 22-24 knots |
| 4 – 10-12 knots | 9 – over 24 knots |

Background: As was originally the case in LMR, both the old and new VS codes are stored in the same field, to be differentiated by date (but DS and VS were named SC and SS in LMR). In IMMPC format documentation, Code 4451 may have been used to refer to both the old and new VS codes. Further research is needed to clarify the timing and details of that apparent code change.

13) NID national source indicator

A field available for national use in identifying data subsets.

Background: IMMT has a similar 1-character field for “national use” (see Supp. B, Table B2), which thus far has not been translated into this (or another) IMMA field. NID was set to “1” by the Data Assembly Center (DAC; at NOAA/NCEI) for identified VOSclim ships, or to missing otherwise. [Note: Presently in R3.0 not all VOSclim ships were identified in all data sources, such that this indicator was set only sporadically. R3.0 VOSclim data obtained in the ICOADS-standard format should be identifiable by NID=1.]

14) // ID indicator

15) ID identification/callsign

// indicates whether a callsign or some other sort of identification is contained in the ID field (and in R3.0 data, // should always be extant when ID information exists; whereas // should always be missing if ID is missing):

- 0 – ID present, but unknown type
- 1 – ship, Ocean Station Vessel (OSV), or ice station callsign
- 2 – generic ID (e.g., SHIP, BUOY, RIGG, PLAT)
- 3 – WMO 5-digit buoy number
- 4 – other buoy number (e.g., Argos or national buoy number)
- 5 – Coastal-Marine Automated Network (C-MAN) ID (assigned by US NDBC or other organizations)
- 6 – station name or number
- 7 – oceanographic platform/cruise number
- 8 – fishing vessel pseudo-ID
- 9 – national ship number
- 10 – composite information from early ship data
- 11 – 7-digit buoy ID (proposed)

Background: ID is extended to nine characters (versus e.g., seven in IMMT-5). In platform track checking, for example, consideration should be given to using a combination of // and ID, since identical IDs can sometimes have different // values and thus may represent different platforms. [Note: ICOADS processing normally left-justifies extant information stored within ID (with right blank-fill). GTS reports generally contain a radio callsign or WMO buoy identification number (<http://www.wmo.int/pages/prog/amp/mmop/wmo-number-rules.html>), but early IMM logbook reports sometimes contained IDs such as national ship numbers and “log” numbers (see Table B4). Documentation of the format of such numbers generally appears to be unavailable (but could potentially be sought from individual countries), thus //9 has generally been assigned only for earlier (pre-IMM) card decks for which the format of the information was known.] //11 is listed as proposed since new 7-digit buoy IDs exist, but are not presently marked

as such in R3.0 of ICOADS. Future expansion of the list of // values is likely with the advent of new WMO identifiers (e.g., WIGOS).

16) C1 country code

The country that recruited a ship, which may differ from the country of immediate receipt (C2, field 15) and may also differ from the ship's registry. WMO transitioned from the older numeric code values 0-40 (Table D1) to the current 2-character ISO 3166 (http://www.iso.org/iso/country_codes.htm) alphabetic codes effective 1 Jan. 1998.

Background: Both the older numeric codes for historical data, and the alphabetic codes for more recent data, are stored in this field (since e.g., the old numeric codes include the USSR and other former country names). [Note: The older numeric codes were "according to numbers assigned by WMO" (see IMMT-1 documentation in WMO 1993a). Some deficiencies in NCDC's processing many years ago of early IMM receipts, involving missing country codes and card "overpunch" handling, are discussed in the LMR documentation.]

Table D1. WMO numeric country codes (now obsolete).

<u>C1</u>	<u>Country</u>	<u>C1</u>	<u>Country</u>	<u>C1</u>	<u>Country</u>	<u>C1</u>	<u>Country</u>
0	Netherlands	10	Ireland	20	Sweden	30	Spain
1	Norway	11	Philippines	21	FRG	31	Thailand
2	US	12	Egypt	22	Iceland	32	Yugoslavia
3	UK	13	Canada	23	Israel	33	Poland
4	France	14	Belgium	24	Malaysia	34	Brazil
5	Denmark	15	South Africa	25	USSR	35	Singapore
6	Italy	16	Australia	26	Finland	36	Kenya
7	India	17	Japan	27	Rep. of Korea	37	Tanzania
8	Hong Kong	18	Pakistan	28	New Caledonia	38	Uganda
9	New Zealand	19	Argentina	29	Portugal	39	Mexico
						40	GDR

Regular section

17) DI wind direction indicator

18) D wind direction

DI gives the compass (and approximate precision) used for reporting the wind direction:

- 0 – 36-point compass
- 1 – 32-point compass
- 2 – 16 of 36-point compass
- 3 – 16 of 32-point compass
- 4 – 8-point compass
- 5 – 360-point compass
- 6 – high resolution data (e.g., tenths of degrees)

D is the direction (true) from which wind is blowing (or will blow), stored in whole degrees (i.e., 360-point compass; range: 1-360°), or special codes:

- 361 – calm
- 362 – variable, or all directions

Table D2 lists the standard mappings used in ICOADS of contemporary (WMO Code 0877) and historical ship wind direction codes into degrees.

Background: IMMT-5 follows WMO Code 0877 (including 00 for calm, and 99 for variable). In FM 13, stations within 1° of the North Pole instead use Code 0878 (WMO 2015). In designing *D* to store both high- and low-resolution directions, an unambiguous and numerically closed range (i.e., 1-362, rather than e.g., 0-360,

999=variable) was deemed advantageous for computational reasons (e.g., range checking).

Table D2. Translation of contemporary ($DI=0$; WMO Code 0877) and some historical (shaded) ship wind direction codes ($DI=1-3$ as represented in NCDC 1968) into degrees (blank indicates an undefined conversion) for storage of wind direction in *D*. *Release 1*, supp. F provides the original rationale for the degree values shown in this table and further background information (including uncertainties associated with past usage of $DI=4$ in ICOADS, see Table F2-1 in http://icoads.noaa.gov/Release_1/suppF.html).

<i>WMO Code 0877</i>		<i>DI</i>				
<i>Code</i>	<i>Range</i>	<i>0</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>
01	5-14	10	11			?
02	15-24	20	23	25	23	?

99 (variable)		362	362	362	362	

19) *W/* wind speed indicator

20) *W* wind speed

Wind speed is stored in tenths of a meter per second (to retain adequate precision for winds converted from knots, or high-resolution data). *W/* shows the units in which and/or the method by which *W* was originally recorded (0, 1, 3, 4 follow WMO Code 1855):

- 0 – meter per second, estimated
- 1 – meter per second, obtained from anemometer (measured)
- 2 – estimated (original units unknown)
- 3 – knot, estimated
- 4 – knot, obtained from anemometer (measured)
- 5 – Beaufort force (based on documentation)
- 6 – estimated (original units unknown)/unknown method
- 7 – measured (original units unknown)
- 8 – high-resolution measurement (e.g., hundredths of a meter per second)

Background: No indication is given as to the incoming units and precision of *W*, e.g., whole knots. For reports derived from e.g., TDF-11 format (NCDC 1968), the meaning of *W*=6 either is “estimated (units unknown),” or “both method and units unknown” (i.e., the indicator was missing). This unfortunate ambiguity derives from the dual meaning present in some original archive formats, including IMMPC (ref. Supp. B). [Note: In earlier ICOADS processing, *W*=2 and *W*=7 were used for reversion of deck 555 from the original “SPOT” format; however, no missing value was available in the SPOT format, thus both those *W* settings should be interpreted with caution.]

21) *VI* visibility indicator

22) *VV* visibility

VV (horizontal visibility at the surface in kilometers) according to WMO Code 4377 from which, in reporting visibility at sea, WMO (2009a; Reg. 12.2.1.3.2) states that the decile 90-99 shall be used (moreover Reg. 12.2.1.3.1: when the horizontal visibility is not the same in different directions, the shortest distance shall be given for *VV*):

- 90 – less than 0.05 kilometer
- 91 – 0.05
- 92 – 0.2
- 93 – 0.5
- 94 – 1
- 95 – 2
- 96 – 4
- 97 – 10
- 98 – 20
- 99 – 50 or more

VI shows whether *VV* was:

- 0 – estimated (or unknown method of observation)
- 1 – measured
- 2 – fog present (obsolete)

Background: The “Cloud height and visibility measuring indicator” from IMMT-5 is separated into independent indicators in IMMA format, *HI* (see field 39) and *VI*. [Note: When *VI*=2, and *VV*=93, it meant that fog was present and visibility was not reported (NCDC 1968). This “fog present” combination of *VI*=2 with *VV*=93 appears to originate from “overpunch” procedures that took effect in the IMMPC format around 1966 (see Table B2) as translated into the TDF-11 format.]

23) *WW* present weather

24) *W1* past weather

WMO Codes 4677 (Table D3) for *WW*, and 4561 for *W1*:

- 0 – Cloud covering 1/2 or less of the sky throughout the appropriate period
- 1 – Cloud covering more than 1/2 of the sky during part of the appropriate period and covering 1/2 or less during part of the period

- 2 – Cloud covering more than 1/2 of the sky throughout the appropriate period
- 3 – Sandstorm, duststorm or blowing snow
- 4 – Fog or ice fog or thick haze
- 5 – Drizzle
- 6 – Rain
- 7 – Snow, or rain and snow mixed
- 8 – Shower(s)
- 9 – Thunderstorm(s) with or without precipitation

For use of weather data starting 1 Jan. 1982, also refer to *IX* (C5, field 7).

Background: WMO Code 4561 also applies to *W2* (C5, field 8). WMO Codes 4680 (W_aW_a) and 4531 ($W_{a1}W_{a2}$) (not shown) are used instead for reporting present and past weather from an automatic weather station (see WMO 2015). Those alternative Codes have the same numerical ranges as *WW* (00-99) and *W1/W2* (0-9) but different meanings, and *IX* must be used to determine which codes are being utilized..

Table D3. WMO Code 4677 for present weather (*WW*) (after WMO 2015). Leading zero is omitted in IMMA. Large multi-line braces (“{” and “}”) as appear in WMO (2009a) are reproduced in this table by denoting the code groups to which text characteristics given in the first column (e.g., “No meteors except photometeors”) or last column apply by listing the codes in square [brackets] (e.g., “[00-03]”).

	Code		
<i>WW</i> = 00-49		<i>No precipitation at the station at the time of observation</i>	
<i>WW</i> = 00-19		No precipitation, fog, ice fog (except for 11 and 12), duststorm, sandstorm, drifting or blowing snow at the station at the time of observation or, except for 09 and 17, during the preceding hour	
	Code		
No meteors except photometeors [00-03]	00	Cloud development not observed or not observable	[00-03] Characteristic change of the state of sky during the past hour
	01	Clouds generally dissolving or becoming less developed	
	02	State of sky on the whole unchanged	
	03	Clouds generally forming or developing	
Haze, dust, sand or smoke [04-09]	04	Visibility reduced by smoke, e.g., veldt or forest fires, industrial smoke or volcanic ashes	
	05	Haze	
	06	Widespread dust in suspension in the air, not raised by wind at or near the station at the time of observation	
	07	Dust or sand raised by wind at or near the station at the time of observation, but no well-developed dust whirl(s) or sand whirl(s), and no duststorm or sandstorm seen; or, in the case of ships, blowing spray at the station	
	08	Well-developed dust whirl(s) or sand whirl(s) seen at or near the station during the preceding hour or at the time of observation, but no duststorm or sandstorm	
	09	Duststorm or sandstorm within sight at the time of observation, or at the station during the preceding hour	
	10	Mist	[11-12] shallow fog or ice fog at the station, whether on land or sea, not deeper than about 2 metres on land or 10 metres at sea
	11	Patches	
	12	More or less continuous	
	13	Lightning visible, no thunder heard	

	Code		
	14	Precipitation within sight, not reaching the ground or the surface of the sea	
	15	Precipitation within sight, reaching the ground or the surface of the sea, but distant, i.e., estimated to be more than 5 km from the station	
	16	Precipitation within sight, reaching the ground or the surface of the sea, near to, but not at the station	
	17	Thunderstorm, but no precipitation at the time of observation	
	18 19	Squalls Funnel cloud(s) ²	
WW = 20-29		Precipitation, fog, ice fog or thunderstorm at the station during the preceding hour but not at the time of observation	
	20	Drizzle (not freezing) or snow grains	[20-24] not falling as shower(s)
	21	Rain (not freezing)	
	22	Snow	
	23	Rain and snow or ice pellets	
	24	Freezing drizzle or freezing rain	
	25	Shower(s) of rain	
	26	Shower(s) of snow, or of rain and snow	
	27	Shower(s) of hail ³ , or of rain and hail ³	
	28	Fog or ice fog	
29	Thunderstorm (with or without precipitation)		
WW = 30-39		Duststorm, sandstorm, drifting or blowing snow	
	30	Slight or moderate duststorm or sandstorm – has decreased during the preceding hour	
	31	Slight or moderate duststorm or sandstorm – no appreciable change during the preceding hour	
	31	Slight or moderate duststorm or sandstorm – has begun or has increased during the preceding hour	
	33	Severe duststorm or sandstorm – has decreased during the preceding hour	
	34	Severe duststorm or sandstorm – no appreciable change during the preceding hour	
	35	Severe duststorm or sandstorm – has begun or has increased during the preceding hour	
	36	Slight or moderate drifting snow	[36-37] generally low (below eye level)
	37	Heavy drifting snow	
	38	Slight or moderate blowing snow	[38-39] generally high (above eye level)
	39	Heavy blowing snow	
WW = 40-49		Fog or ice fog at the time of observation	
	40	Fog or ice fog at a distance at the time of observation, but not at the station during the preceding hour, the fog or ice fog extending to a level above that of the observer	
	41	Fog or ice fog in patches	
	42	Fog or ice fog, sky visible	[42-43] has become thinner during the preceding hour
	43	Fog or ice fog, sky invisible	
	44	Fog or ice fog, sky visible	[44-45] no appreciable change during the preceding hour
	45	Fog or ice fog, sky invisible	
	46	Fog or ice fog, sky visible	[46-47] has begun or has become thicker during the preceding hour
	47	Fog or ice fog, sky invisible	
	48	Fog, depositing rime, sky visible	
49	Fog, depositing rime, sky invisible		
WW = 50-99		Precipitation at the station at the time of observation	
WW = 50-59		Drizzle	
	50	Drizzle, not freezing, intermittent	[50-51] slight at time of observation
	51	Drizzle, not freezing, continuous	

	Code		
	52	Drizzle, not freezing, intermittent	[52-53] moderate at time of observation
	53	Drizzle, not freezing, continuous	
	54	Drizzle, not freezing, intermittent	[54-55] heavy (dense) at time of observation
	55	Drizzle, not freezing, continuous	
	56	Drizzle, freezing, slight	
	57	Drizzle, freezing, moderate or heavy (dense)	
	58	Drizzle and rain, slight	
	59	Drizzle and rain, moderate or heavy	
WW = 60-69		Rain	
	60	Rain, not freezing, intermittent	[60-61] slight at time of observation
	61	Rain, not freezing, continuous	
	62	Rain, not freezing, intermittent	[62-63] moderate at time of observation
	63	Rain, not freezing, continuous	
	64	Rain, not freezing, intermittent	[64-65] heavy (dense) at time of observation
	65	Rain, not freezing, continuous	
	66	Rain, freezing, slight	
	67	Rain, freezing, moderate or heavy	
	68	Rain or drizzle and snow, slight	
	69	Rain or drizzle and snow, moderate or heavy	
WW = 70-79		Solid precipitation not in showers	
	70	Intermittent fall of snowflakes	[70-71] slight at time of observation
	71	Continuous fall of snowflakes	
	72	Intermittent fall of snowflakes	[72-73] moderate at time of observation
	73	Continuous fall of snowflakes	
	74	Intermittent fall of snowflakes	[74-75] heavy (dense) at time of observation
	75	Continuous fall of snowflakes	
	76	Diamond dust (with or without fog)	
	77	Snow grains (with or without fog)	
	78	Isolated star-like snow crystals (with or without fog)	
	79	Ice pellets	
WW = 80-99		Showery precipitation, or precipitation with current or recent thunderstorm	
	80	Rain shower(s), slight	
	81	Rain shower(s), moderate or heavy	
	82	Rain shower(s), violent	
	83	Shower(s) of rain and snow mixed, slight	
	84	Shower(s) of rain and snow mixed, moderate or heavy	
	85	Snow shower(s), slight	
	86	Snow shower(s), slight	
	87	Shower(s) of snow pellets or small hail, with or – without rain or rain and snow mixed	Slight
	88	Shower(s) of snow pellets or small hail, with or – without rain or rain and snow mixed	Heavy
	89	Shower(s) of hail ⁴ , with or without rain or rain and snow mixed, not associated with thunder	Slight
	90	Shower(s) of hail ⁴ , with or without rain or rain and snow mixed, not associated with thunder	Heavy
	91	Slight rain at time of observation	[91-94] Thunderstorm during the preceding hour but not at time of observation
	92	Moderate or heavy rain at time of observation	
	93	Slight snow, or rain and snow mixed or hail ³ at time of observation	
	94	Moderate or heavy snow, or rain and snow mixed or hail ³ at time of observation	
	95	Thunderstorm, slight or moderate, without hail ³ , but with rain and/or snow at time of observation	[95-99] Thunderstorm at time of observation
	96	Thunderstorm, slight or moderate, with hail ³ at time of observation	
	97	Thunderstorm, heavy, without hail ³ , but with rain and/or snow at time of observation	

	Code	
	98	Thunderstorm combined with duststorm or sandstorm at time of observation
	99	Thunderstorm, heavy, with hail ³ at time of observation

1. The expression "at the station" refers to a land station or a ship.
2. Tornado cloud or water-spout.
3. Hail, small hail, snow pellets. French: grêle, grésil ou neige roulée.
4. French: grêle.

25) SLP sea level pressure

26) A barometric tendency

27) PPP amount of pressure tendency

SLP and *PPP* (amount of pressure tendency at station level during the three hours preceding the time of observation) in tenths of hPa (i.e., millibars), and *A* according to WMO Code 0200 (Table D4).

Background: IMMT-5 contains a 4-character (PPPP) representation of *SLP* in (dropping the leading digit). WMO (2009a) Reg. 12.1.3.7, Note (3) describes how for auxiliary ships *SLP* (similarly to *AT*, as discussed below) still may be reported to whole hPa (using the solidus "/" for the tenths position, which was probably generally set to zero in translated GTS data, with a resulting loss of precision information).

Table D4. WMO Code 0200 for characteristic of pressure tendency during the three hours preceding the time of observation (*A*) (after WMO 2015).

Code	Definition	Additional definition related to codes in brackets [].
0	Increasing, then decreasing; atmospheric pressure the same or higher than three hours ago	[1-3] Atmospheric pressure now higher than three hours ago
1	Increasing, then steady; or increasing, then increasing more slowly	
2	Increasing (steadily or unsteadily) ¹	
3	Decreasing or steady, then increasing; or increasing, then increasing more rapidly	[6-8] Atmospheric pressure now lower than three hours ago
4	Steady; atmospheric pressure the same as three hours ago ¹	
5	Decreasing, then increasing; atmospheric pressure the same or lower than three hours ago	
6	Decreasing, then steady; or decreasing, then decreasing more slowly	[6-8] Atmospheric pressure now lower than three hours ago
7	Decreasing (steadily or unsteadily) ¹	
8	Steady or increasing, then decreasing; or decreasing, then decreasing more rapidly	

1. For reports from automatic stations, see Reg. 12.2.3.5.3.

28) IT indicator for temperatures

29) AT air temperature (i.e., dry bulb)

30) WBTI *WBT* indicator

31) WBT wet-bulb temperature

32) DPTI *DPT* indicator

33) DPT dew-point temperature

34) SI *SST* method indicator

35) SST sea surface temperature

Temperatures are stored in tenths of a degree Celsius.

IT provides information about the precision and/or units that the *Core* temperature elements were translated from:

- 0 – tenths °C
- 1 – half °C
- 2 – whole °C
- 3 – whole or tenths °C (mixed precision among temperature fields)
- 4 – tenths °F
- 5 – half °F
- 6 – whole °F
- 7 – whole or tenths °F (mixed precision among temperature fields)
- 8 – high resolution data (e.g., hundredths °C)
- 9 – other

Background: For *IT*, 0-2 match $i_T=3-5$ in IMMT-5; the full configuration matches predecessor field *T1* in LMR. Early historical temperatures may have also been reported in degrees Réaumur, mixed units, etc.; additional fields may be desirable in the historical *attn* to record such details. WMO (2009a) Reg. 12.1.3.7, Note (3) describes how for auxiliary ships *AT* (similarly to *SLP*, as discussed above) still may be reported to whole degrees (using the solidus “/” for the tenths position, which was probably generally set to zero in translated GTS data, with a resulting loss of precision information). Only starting in 1982 could *DPT* be reported to tenths in the SHIP code, and only starting 2 Nov. 1994 did it become possible to report *WBT* (to tenths) in FM 13.

WBTI and *DPTI* indicate which of *WBT* or *DPT* was measured or computed, and ice bulb conditions:

- 0 – measured
- 1 – computed
- 2 – iced measured
- 3 – iced computed

Background: *WBTI* and *DPTI* are derived from sign positions s_w and s_t in IMMT-5. [Note: For data originally translated into LMR from IMMT formats, the predecessor LMR field *T2* preserved only a subset of information derived from s_w and s_t , coupled with whether *DPT* was computed during ICOADS processing. Future work should seek to recover more complete information for data that were translated to IMMA from LMR, and consider new configurations to separately document ICOADS processing. WMO (2009a) Reg. 12.2.3.3.1 specifies when (e.g., owing to instrument failure) relative humidity (RH) is available and may be reported in FM 13 instead of *DPT* in an alternative group 29UUU. For R3.0, we are now translating more *RH* data into the IMMA1 *Immt* *attn*, both from modern GTS and IMMT sources.]

SI shows the method by which *SST* was taken:

- 0 – bucket
- 1 – condenser inlet (intake)
- 2 – trailing thermistor
- 3 – hull contact sensor
- 4 – through hull sensor
- 5 – radiation thermometer
- 6 – bait tanks thermometer
- 7 – others
- 9 – unknown or non-bucket
- 10 – “implied” bucket [note: applicable to early ICOADS data]
- 11 – reversing thermometer or mechanical sensor
- 12 – electronic sensor

Background: 0-7 follow the IMMT-5 code. Except for omitting $SI=8$ (“unknown”), this is a direct mapping from the LMR configuration. SI values should be used with extreme caution in earlier data (see discussion of “bucket indicators” in sec. 4 of *Release 1*). [Note: In translation from LMR, $SI=8$ was made missing ($SI=8$ indicated that no information was available; it resulted from a conversion error applicable only to decks 705-707). For data translated from IMM formats effective since 1982, $SI=7$ refers to “other than 0-6,” because the only other extant values were 0-6. For FM 13 data reported since 2 Nov. 1994 (when SI information first became available on GTS), in contrast, $SI=7$ refers to “other than 0-1 or 3,” because the only other extant values were equivalent to 0-1 or 3. $SI=9$ arose because a distinct missing value was not available in some earlier IMM and archive formats, e.g., in NCDC (1968) a blank in the SST indicator field for deck 128 meant “determined by other than bucket method,” but blank also generally signified a missing field in that format.]

36) N total cloud amount (cover)

37) NH lower cloud amount

For N , codes 0 to 9 (WMO Code 2700) show the total fraction of the celestial dome covered by clouds (irrespective of their genus). For NH (also WMO Code 2700) they show the amount of all the low (CL) cloud present or, if no CL cloud is present, the amount of all the middle (CM) cloud present:

0 – clear

1 – 1 okta or less, but not zero

2-6 – 2-6 oktas

7 – 7 oktas or more, but not 8 oktas

8 – 8 oktas

9 – sky obscured by fog and/or other meteorological phenomena

Background: In WMO 2015 (WMO Code 2700), N is termed “total cloud cover.” This description adopts the current WMO Code 2700 definition of code 9, which in LMR was defined as “sky obscured or cloud amount cannot be estimated” (as in Met Office 1948). The solidus (“/”) is defined as a further possibility in WMO Code 2700 as “Cloud cover is indiscernible for reasons other than fog or other meteorological phenomena, or observation is not made,” which should have been translated into missing data in IMMA. [Note: Historically “/” was omitted e.g., from Met Office 1948 and NCDC 1968, and thus also not included in *Release 1* or current LMR configurations for N and NH . In contrast CL , H , CM , and CH have always had an ICOADS configuration (“A” in IMMA) corresponding to “/” separate from missing data (see also background notes following CH , field 42).]

38) CL low cloud type

Codes 0 to 10 [A in base36 encoding] show characteristics observed of clouds of the genera Stratocumulus, Stratus, Cumulus, and Cumulonimbus (WMO Code 0513; see also background notes following CH , field 42).

39) HI cloud height indicator

HI shows if cloud height H was:

0 – estimated

1 – measured

Background: The “Cloud height and visibility measuring indicator” from IMMT-5 is separated into independent indicators in IMMA format, HI and VI (see field 21).

40) H cloud height

Codes 0 to 9 and “A” (following WMO Code 1600) show the height above surface of the base of the lowest cloud seen (such that a height exactly equal to one of the values at

the ends of the ranges shall be coded in the higher range, e.g., a height of 600 m shall be reported by code 5):

0 – 0 to 50 m

1 – 50 to 100 m

2 – 100 to 200 m

3 – 200 to 300 m

4 – 300 to 600 m

5 – 600 to 1000 m

6 – 1000 to 1500 m

7 – 1500 to 2000 m

8 – 2000 to 2500 m

9 – 2500 m or more, or no clouds

10 [A in base36 encoding] – height of base of cloud not known or base of clouds at a level lower and tops at a level higher than that of the station

Background: Further notes regarding WMO Code 1600 (WMO 2015) concern *H* data reported from automatic stations.

41) *CM* middle cloud type

Codes 0 to 10 [A in base36 encoding] show characteristics observed of clouds of the genera *Alto*cumulus, *Alto*stratus, and *Nimbo*stratus (WMO Code 0515).

42) *CH* high cloud type

Codes 0 to 10 [A in base36 encoding] show characteristics observed of clouds of the genera *Cirrus*, *Cirrocumulus* and *Cirrostratus* (WMO Code 0509).

Background: Configurations for *CL*, *H*, *CM*, and *CH* are as in IMMT-5, except for use of “A” (10 in base36) in place of “/” (LMR used 10 in place of “/”). Analyses of cloud types may be impacted by a 1 Jan. 1982 GTS code change: When *N*=0, the types *CM*, *CH*, and *CL* were reported as missing (i.e., the FM 13 8NhC_LC_MC_H group was omitted), whereas previously these types may have been reported zero (see Hahn et al. 1992). However, to improve climatological data quality, starting 2 Nov. 1994 FM 13 was again modified so that all cloud observations at sea including no cloud observation shall be reported (see WMO 2015, Reg. 12.2.7.1). [Note: For historical reasons (see background under *NH*, field 37), an inconsistency exists in IMMA in how solidus (“/”) is translated for *N* and *NH* (i.e., to missing data) versus for *CL*, *H*, *CM*, and *CH* (i.e., to “A”). A related complication (i.e., in terms of preserving information about whether data were explicitly reported as “/” versus omitted from transmission) is that group Nddff in FM 13 is mandatory, whereas 8NhC_LC_MC_H can be omitted (Reg. 12.2.7.1).]

43) *WD* wave direction

Starting in 1968, *WD* was no longer reported in the SHIP code. Codes 00 to 36 (note: leading zero is omitted in IMMA) show the direction (if any) from which (wind) waves come, in tens of degrees (following WMO Code 0877; ref. Code and Range columns in Table D2). Codes 37 and 38 show:

37 – waves confused, direction indeterminate ($WH \leq 4.75$ m)

38 – waves confused, direction indeterminate ($WH > 4.75$ m; or irrespective of wave height, corresponding to 99 in WMO Code 0877)

44) *WP* wave period

Period of wind waves, in seconds. Starting in 1968, *WP* was reported in seconds; prior to 1968 the period was reported as a code, which was converted into whole seconds following Table D5a, with *WX* (C1, field 13) set accordingly.

45) *WH* wave height

Height of wind waves, in units of 0.5 m (i.e., 1=0.5 m, 2=1 m, etc.).

Background: Historically, the (wind) wave and swell codes have been subject to complex changes. Prior to 1949 both sets of fields were apparently reported descriptively in the SHIP code, and thus are expected to be missing (and the swell fields are expected to be missing prior to 1 July 1963, as discussed below). Codes 37-38 arise from earlier historical codes (see Met Office 1948). Starting in 1968, *WD* was no longer reported and *WP* was reported in seconds. [Note: *WP*=99, indicating a confused sea, is defined in IMMA, but not in use in R3.0. Future work should seek to recover confused sea information from original formats. Some NDBC wave data currently are transformed for storage in Table C5 fields (potentially inappropriate). Specifically, ICOADS contains increasing amounts of measured wave data from NOAA National Data Buoy Center (NDBC) moored buoys in the vicinity of the US coastline. These variables, in the NCDC (2003) TD-1171 format (<ftp://ftp.ncdc.noaa.gov/pub/data/documentlibrary/tddoc/td1171.pdf>, Note: no longer produced, since NDBC and NCEI have adopted a netCDF format going forward from ~2012), have been translated into IMMA variables (with a loss of data resolution, at least in the case of *WD*, which is represented in degrees in TD-1171 (e.g., 0-360) as compared to coded units of ten degrees in IMMA, e.g., 0-36):

WD = principal wave direction (pos. 84-86 in TD-1171)

WH = significant wave height (pos. 75-77 in TD-1171)

WP = dominant wave period (pos. 78-80 in TD-1171)]

46) *SD* swell direction

47) *SP* swell period

48) *SH* swell height

Configurations similar to the corresponding wave fields *WD*, *WP*, and *WH*. Prior to 1968 (1968-1982), *SP* was reported as a code, which was converted into whole seconds per Table D5a (Table D5b), with *SX* (*C1*, field 14) set accordingly.

Background: Beginning 1 July 1963 both sea (i.e., wind wave) and swell were reported. Prior to that date only the higher of sea and swell was reported. Starting in 1982, *SP* was reported in seconds.

Table D5a. Conversion for *WP* always, and for *SP* prior to 1968.

<u>Seconds</u>	<u>Code</u>	<u>Interval</u>
5	2	5 seconds or less
7	3	6-7 seconds
9	4	8-9 seconds
11	5	10-11 seconds
13	6	12-13 seconds
15	7	14-15 seconds
17	8	16-17 seconds
19	9	18-19 seconds
21	0	20-21 seconds
22	1	over 21 seconds
0	–	calm or period not determined

Table D5b. Conversion for *SP* beginning 1 January 1968 and ending in 1982.

<u>Seconds</u>	<u>Code</u>	<u>Interval</u>
10	0	10 seconds
11	1	11 seconds
12	2	12 seconds
13	3	13 seconds

14	4	14 seconds or more
5	5	5 seconds or less
6	6	6 seconds
7	7	7 seconds
8	8	8 seconds
9	9	9 seconds
0	–	calm or period not determined

ICOADS (*Icoads*) attm (C1)

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=1 for *Icoads*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes.

Box elements

3) BSI box system indicator

4) B10 10° box number

5) B1 1° box number

10° and 1° box numbers (see *Release 1*, supp. G; http://icoads.noaa.gov/Release_1/suppG.html) are available e.g., for use in sorting operations. The box system indicator is currently unused.

Background: *BSI* provides flexibility in case other box requirements arise (i.e., future extant values of *BSI* could indicate different contents in *B10* and *B1*). *Release 1*, supp. G also describes the obsolete Marsden Square (MSQ) system.

Processing elements

6) DCK deck

Number of the deck from which the report came (Table D6a), with Tables D6b and D6c providing additional information about selected *DCK* ranges. “Deck” originally referred to a punched card deck, but is now used as the primary field to track ICOADS data collections. Each deck may contain a single Source ID (*SID*) or a mixture of *SIDs* (see C1, field 7 for additional information about the relationship between these two fields, and with the format of supplemental data).

Table D6a. Deck assignments (adapted regarding R2.5 from Table AII in Woodruff et al. 2011). For each deck number, the description, starting and ending years, and number of reports (in thousands) are listed for R2.5 and R3.0 output (blanks in these columns indicate that no data were input and/or output¹). Decks replaced or augmented in R3.0, are listed in **bold**. ICOADS also offers preliminary data (now based on a blend of decks 792-797 and 992-995) extending beyond 2014, but not reflected in the last three columns.

Deck	Description	R2.5			R3.0

1. Some of these decks (ref. LMR documentation) were used in ICOADS prior to R2.5; others have not been used. LMR documentation also defines for real-time data processing unofficial deck numbers 001-009, which are not used for ICOADS.

2. Deck 145 contains daily-averaged data, and up to the early 1990's TAO deck 144 contains average estimates for 2-8 hours depending on the buoy instrument package and power requirements.

3. See Table D6b.

4. See Table D6c.

5. A mixture of US- and foreign-keyed data exists in deck 927 prior to 1980; starting about 1980 deck 927 is believed to contain only US-keyed ships.

Table D6b. UK Met. Office (MetO) Main Marine Data Bank (MDB) deck assignments (equivalent to MDB “series” numbers). For each deck number, the description, starting and ending years, and number of reports (in thousands) are listed for R2.5 and R3.0 output (blanks in the last three columns indicate that no data were input and/or output). Decks entirely new to (or replaced in) R3.0, are listed in **bold**. Assignments falling in the range 201-255 not listed below (217, 219-220, etc.) are not yet assigned. Approximate time periods are also given in the description column from earlier MDB or other external documentation.

1. Believed to be derived from the same original German punched cards as deck 192 (see Table D6a).
2. 1 Jan 1982-26 Jun 1998 (missing: Apr-Jun 82; Mar, Jun, Sep 85; Sep 88). Some non-SHIP (e.g., BUOY) data may also be included in earlier years.
3. 21 Dec 1996-23 Feb 1998.

Table D6c. Deck assignments for early US National Data Buoy Center (NDBC) data (decks 876-882), and the latest version from NCDC of NDBC data (deck 883). For each deck number, the description, starting and ending years, and number of reports (in thousands) are listed for R2.5 and R3.0 output (blanks in the last three columns indicate that no data were input and/or output¹). Initially, separate deck numbers 876-880 were assigned to indicate hull design, etc.¹ At a later date, this convention was abandoned, such that decks 882 and 883 were used for all data.

Deck	Description	R2.5			R3.0		
		Start	End	Rpts K	Start	End	Rpts K
876	NDBC Data (High Capability Buoy; HCB)	1972	1977	36	1972	1977	36

880	NDBC Data (10-meter Continental Shelf Buoys)	1976	1978	8	1976	1978	8
881	NDBC Data (Offshore Platforms)	1976	1977	1	1976	1977	1
882	NDBC Data	1978	1979	175	1978	1979	175
883	NDBC Data (latest version from NCDC)	1980	2004	20 538	1980	2012	49 763

1. Hull design information is based on informal NCDC documentation (NCDC 1972a and 1972b) and D. Gilhousen (NDBC) personal correspondence (13 Dec. 1995).

7) *SID* source ID

Number of the source ID from which the report came (Table D7). Each *SID* may contain a single deck or a mixture of decks, but each *SID* is generally constrained to a single input format. This helps to identify the format of data stored in the supplemental attachment. However, exceptions include UK Marine Data Bank (MDB) data, for which both *DCK* (201-255) and *SID* (90-93) may be required to determine the supplemental format.

*Table D7. Source ID (SID) assignments (adapted in part from Table AIII in Woodruff et al. 2011). For each SID number, the description, starting and ending years, and number of reports (in thousands, where “<1” signifies a report count falling in the range 1-499) are listed for R2.5 and R3.0 output (blanks in the last three columns indicate that no data were input and/or output¹). SIDs entirely new to (or replaced in) R3.0, are listed in **bold**. ICOADS also offers preliminary data (presently based on a blend of SIDs 103 and 114) extending beyond 2014, but not reflected in the last three columns.*

1. Some of these SIDs (ref. LMR documentation) were used in ICOADS prior to R2.5; others have not been used.

2. Originally SID 22 was assigned to *Islas Orcadas* (see *Release 1*, supp. F), but the data were never translated.

3. LMR documentation provides a breakdown of descriptions for *SID* range.

4. Tentative source ID assignment—data are not yet available.

8) PT platform type

The type of observing platform:

0 – US Navy or “deck” log, or unknown

1 – merchant ship or foreign military

2 – ocean station vessel—off station or station proximity unknown

- 3 – ocean station vessel—on station
- 4 – lightship
- 5 – ship
- 6 – moored buoy
- 7 – drifting buoy
- 8 – ice buoy [note: currently unused]
- 9 – ice station (manned, including ships overwintering in ice)
- 10 – oceanographic station data (bottle and low-resolution CTD/XCTD data)
- 11 – mechanical/digital/micro bathythermograph (MBT)
- 12 – expendable bathythermograph (XBT)
- 13 – Coastal-Marine Automated Network (C-MAN) (NDBC operated)
- 14 – other coastal/island station
- 15 – fixed (or mobile) ocean platform (plat, rig)
- 16 – tide gauge
- 17 – high-resolution Conductivity-Temp.-Depth (CTD)/Expendable CTD (XCTD)
- 18 – profiling float
- 19 – undulating oceanographic recorder
- 20 – autonomous pinneped bathythermograph
- 21 – glider

Background: *PT* settings 0-4 are derived from the “OSV or Ship Indicator” in NCDC (1968); *PT* settings 0-1 are very poorly documented and probably should be regarded as equivalent to ship data (*PT*=5).

9) DUPS dup status

Indicates duplicate status (Table D8). For the final R3.0 product, reports with *DUPS*>2 were not output (and landlocked *LZ*=1 reports were eliminated; see *R3.0-stat_trim* [note: in preparation]). However, to allow for more detailed analysis of the processing results and possible adjustments, all those flagged reports were retained in R3.0 “total” datasets (see Supp. E).

Background: Matches predecessor field *DS* in LMR format.

Table D8. Duplicate status (*DUPS*) assignments. In previous Releases, “certain” (C) duplicates were eliminated from the LMR output, and then “uncertain” (U) duplicates were eliminated from LMRF. Settings marked by footnotes apply only to pre-1980 data.

<u>DUPS</u>	<u>U/C</u>	<u>Description</u>
0		unique
1		best duplicate
2		best duplicate with substitution
3	U	worse duplicate: uncertain weather element match with hour cross ¹
4	U	worse duplicate: uncertain weather element match with no cross
5	U	worse duplicate: uncertain weather element match with day cross ²
6	U	worse duplicate: time/space match with <i>ID</i> mismatch (unused until 1950)
7	U	worse duplicate: certain weather element match with hour cross ¹
8	C	worse duplicate: certain weather element match with no cross
9	C	worse duplicate: combined <i>DUPS</i> 4 and 6
10	C	worse duplicate: combined <i>DUPS</i> 6 and 8
11	C	worse duplicate: time/space/ <i>ID</i> match
12	C	worse duplicate: combined <i>DUPS</i> 4 and 11
13	C	worse duplicate: combined <i>DUPS</i> 8 and 11
14	C	automatic data rejection

1. For *Release 1*, applied to 1854-1979 data; for R2.0, applied to 1784-1979 data; for R2.5 and R3.0, applied to 1662-1979 data.

2. For *Release 1*, applied to 1854-1969 data; for R2.0, applied to 1784-1969 data; for R2.5 and R3.0, applied to 1662-1969 data.

10) *DUPC* dup check

The presence of a duplicate match between a Global Telecommunication System (GTS) and logbook (or other delayed-mode) report may provide some location verification, with greater credibility if *SLP* and *SST* match under “allowances.” *DUPC* indicates whether such matches were detected during duplicate elimination processing (either the GTS or delayed-mode report is retained in the output data mixture), in case users might wish to make use of this information for independent quality control purposes:

- 0 – GTS and logbook match with *SLP* and *SST* match
- 1 – GTS and logbook match without *SLP* and *SST* match
- 2 – no GTS and logbook match was encountered

Background: Matches predecessor field *DC* in LMR format.

11) *TC* track check

TC, if set, indicates if a report was:

- 0 – not track checked
- 1 – track checked

Background: This indicator, which refers exclusively to track-checking procedures performed by external data providers, was unused prior to Release 2.0, and remains missing in most data. Specifically, only these decks were set to have *TC*=1 (either for R2.0, or for deck 721 for R3.0):

701	US Maury Collection
702	Norwegian Logbook Collection
704	US Marine Meteorological Journals Collection (1878-94)
721	German Maury Collection (set for R3.0)
733	Russian AARI North Pole (NP) Stations

Consequently, records from these decks with *TC*=1 are also available in R3.0.

12) *PB* pressure bias

PB, if set, indicates questionable sea level pressure data:

- 0 – questionable *SLP*: level 0: individual platform (unused)
- 1 – questionable *SLP*: level 1: deck
- 2 – questionable *SLP*: level 2: deck

Background: All indicator settings unused prior to Release 2.0; still missing in most data (see LMR documentation, <http://icoads.noaa.gov/e-doc/lmr>, for additional information).

13) *WX* wave period indicator

14) *SX* swell period indicator

Unless missing, *WX* and *SX* indicate that the wave and swell periods were converted from code into whole seconds:

- 1 – period converted from code into whole seconds

15) *C2* 2nd country code

The country of immediate receipt (*C2*), which may differ from the recruiting country (*C1*) and may also differ from the ship’s registry.

Background: *C2* was tracked for some earlier receipts of International Maritime Meteorological (IMM) logbook data, but IMM data are now generally received via Global Collecting Centres (GCCs; in Germany and UK). Thus this field is generally missing (see *C1*, field 16 for code tables and additional information).

QC elements

16-27) <u>SQZ-DQA</u>	adaptive QC flags
28) <u>ND</u>	night/day flag
29-34) <u>SF-RF</u>	trimming flags
35-48) <u>ZNC-TNC</u>	NCDC-QC flags
49) <u>QCE</u>	external (e.g., MEDS)
50) <u>LZ</u>	landlocked flag
51) <u>QCZ</u>	source exclusion flags

Quality control and related flags, described in detail in *R3.0-stat_trim* [in preparation].

IMMT-5/FM 13 (*Immt*) attm (C5)

The fields described below are as they appear in IMMT-5. Many reports in R3.0 however come from older IMMT (or IMMPC) versions (see Supp. B) and may not contain data for every field within the *Immt* attm.

- 1) ATTI attm ID
- 2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=5 for *Immt*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes.

3) OS observation source

For International Maritime Meteorological (IMM) logbook data, *OS* shows the observation source:

- 0 – unknown
- 1 –logbook (paper)
- 2 –national telecommunication channels
- 3 –national publications
- 4 – logbook (electronic)
- 5 – global telecommunication channels (GTS)
- 6 –international publications

Background: Because the modified IMMT-4 configuration (developed because of deficiencies in the existing configuration) is not backward compatible, the IMMT version (see Supp. B, Table B2) has been added to IMMA (see C5, field 6) to allow proper interpretation of the observation source. [Note: Formerly in IMMT versions 0-3 (usage now discontinued): codes 1-3 also referred to “National data exchange,” and codes 4-6 also referred to “International data exchange”; distinction added between paper and electronic logbook].

4) OP observation platform

For International Maritime Meteorological (IMM) logbook data, *OP* shows the observation platform:

- 0 – unknown
- 1 – selected ship
- 2 – supplementary ship
- 3 – auxiliary ship
- 4 – registered VOSclim ship
- 5 – fixed sea station (e.g., rig or platform)

- 6 – coastal station
- 7 – *[reserved]*
- 8 – *[reserved]*
- 9 – others/data buoy

Background: Because the modified IMMT-4 configuration (developed because of deficiencies in the existing configuration) is not backward compatible, IMMT version (see Supp. B, Table B2) has been added to IMMA (see C5, field 6) to allow proper interpretation of the observation source. [Note: Formerly in IMMT versions 0-3 (usage now discontinued): code 4 referred to “Automated station/data buoy,” and codes 7-8 referred to “Aircraft” and “Satellite,” respectively].

5) FM FM code version

GTS traditional alphanumeric SHIP code “FM” version (see WMO 2015).

- 0 – previous to FM 24-V
- 1 – FM 24-V
- 2 – FM 24-VI Ext.
- 3 – FM 13-VII
- 4 – FM 13-VIII
- 5 – FM 13-VIII Ext.
- 6 – FM 13-IX
- 7 – FM 13-IX Ext.
- 8 – FM 13-X
- 9 – FM 13-XI
- A – FM 13-XII Ext.
- B – FM 13-XIII
- C – FM 13-XIV Ext.

Background: A 1-character field in IMMT (see Supp. B, Table B2), which is stored in IMMA1 as a 1-character base36 value (see Table 1) to allow for expansion (in IMMA0 *FM* was a 2-character field). Yoshida (2004) describes use at least back to 1949 of the “FM” notation (e.g., in FM 21 SHIP and FM 22 SHIP). [Note: While the IMMT-5 range of this input field is only 0-C, and the IMMA0 range of this field was tightly constrained to 0-8 (reflecting the legal range of the input data at IMMT-2), the IMMA0 range was not increased to account for expansions in the range of this field associated with the intermediate IMMT-3/4 updates. Thus increasing the *FM* max. for IMMA1 accommodates future IMMT field adjustments without requiring adjustment in the IMMA1 configuration (but conversely offers less stringent control on the legality of the *FM* data).]

6) IMMV IMMT version

Indicates the applicable IMMT version within the attm, which accommodates some format evolution problems, e.g., in that some IMMT fields changed meaning between IMMT-3 and IMMT-4.

- 0 – IMMT version just prior to version number being included
- 1 – IMMT-1 (in effect from 2 Nov. 1994)
- 2 – IMMT-2 (in effect from Jan. 2003)
- 3 – IMMT-3 (in effect from Jan. 2007)
- 4 – IMMT-4 (in effect from Jan. 2011)
- 5 – IMMT-5 (in effect from June 2012)

7) IX station/weather indicator

8) W2 second past weather

IX (WMO Code 1860) indicates both whether the station is manned or automatic, and the status of present (*WW*, see C0, field 23) and past (*W1*, *W2*; WMO Code 4561, see C0, field 24) weather data:

- | | |
|---------------|---|
| 1 – manned | included |
| 2 – manned | omitted (no significant phenomenon to report) |
| 3 – manned | omitted (no observation, data not available) |
| 4 – automatic | included [using WMO Codes 4677 and 4561] |
| 5 – automatic | omitted (no significant phenomenon to report) |
| 6 – automatic | omitted (no observation, data not available) |
| 7 – automatic | included using WMO Codes 4680 and 4531 |

Background: Starting 1 Jan. 1982, the procedure for reporting present (*WW*) and past (*W1*, *W2*) weather in FM 13 was altered significantly by adding *IX*, which allowed the “7 group” (7ww*W1W2* for manual stations, and usually 7w_aw_aW_{a1}W_{a2} for automatic stations) to be omitted when there was no significant present or past weather to report (see Hahn et al. 1992). However, to improve climatological data quality, starting 2 Nov. 1994 FM 13 was again modified so that any present and past weather including phenomena without significance shall be reported (see WMO 2015, Reg. 12.2.6.2). [Note: Refer to the LMR documentation for more information regarding use of *IX* with present and past weather data, and unforeseen complications attending its introduction in 1982 (e.g., *IX* was not included in IMMT until 1 March 1985). *IX*=4 was initially defined (WMO 1981) without the Code references (hence brackets above), and *IX*=7 was introduced at a later date. The *IX*=7 value was not included in LMR, thus future work should seek to recover this information for data that were translated to IMMA from LMR.]

9) *WMI* indicator for wave measurement

WMI corresponds to the IMMT-5 “indicator for wave measurement”:

- | | |
|---|--------------------------|
| 0 – wind sea and swell estimated | shipborne wave recorder |
| 1 – wind sea and swell measured | shipborne wave recorder |
| 2 – mixed wave measured, swell estimated | shipborne wave recorder |
| 3 – other combinations measured and estimated | shipborne wave recorder |
| 4 – wind sea and swell measured | buoy |
| 5 – mixed wave measured, swell estimated | buoy |
| 6 – other combinations measured and estimated | buoy |
| 7 – wind sea and swell measured | other measurement system |
| 8 – mixed wave measured, swell estimated | other measurement system |
| 9 – other combinations measured and estimated | other measurement system |

Background: Note: Field not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

10) *SD2* swell direction (2nd)

11) *SP2* swell period (2nd)

12) *SH2* swell height (2nd)

Configurations as for *SD*, *SP*, and *SH* (C0, fields 46-48).

Background: [Note: Fields not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

13) *IS* ice accretion

Accretion on the ship according to WMO Code 1751:

- 1 = icing from ocean spray
- 2 = icing from fog

- 3 = icing from spray and fog
- 4 = icing from rain
- 5 = icing from spray and rain

14) ESice thickness

Ice accretion thickness on the ship in centimeters.

15) RSIce accretion rate

Accretion rate on the ship according to WMO Code 3551:

- 0 = ice not building up
- 1 = ice building up slowly
- 2 = ice building up rapidly
- 3 = ice melting or breaking up slowly
- 4 = ice melting or breaking up rapidly

16) IC1 concentration of sea ice

17) IC2 stage of development

18) IC3 ice of land origin

19) IC4 true bearing ice edge

20) IC5 ice situation/trend

The fields changed dramatically in 1982 (field names reflect the 1982 Codes):

pre-1982

description of ice type

effect of ice on navigation

bearing of principal ice edge

distance to ice edge

orientation of ice edge

starting 1 Jan. 1982

concentration of ice (WMO Code 0639)

stage of ice development (WMO Code 3739)

ice of land origin (WMO Code 0439)

true bearing principal ice edge (WMO Code 0739)

ice situation/trend (WMO Code 5239)

IMMA stores the old/new information as listed above in the same field, thus making it critical that users be aware of the code change. Configurations are as in IMMT-5 except for use of "A" (10 in base36) in place of "/."

Background: Separate fields (or an Code indicator) could be considered in the future. Earlier historical ice codes might also need to be researched for possible consideration. Met Office (1948) lists an Ice Group (c₂KD_ire) that may be similar or identical to the above pre-1982 code (see also Table B4 of Supp. B). Ice codes used at least for early telecommunicated data from ~1947-82 can be found at http://icoads.noaa.gov/reclaim/pdf/Met_O_509.pdf. [Note: Fields not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

21) IR indicator for precipitation data

22) RRR amount of precipitation

23) TR duration of period of reference for amount of precipitation

WMO Codes 1819, 3590, and 4019, respectively. Configurations are as in IMMT-5.

Background: [Note: Fields not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

24) NU National use

A field available for national use in identifying data subsets copied from IMMT format.

25) QCI quality control (QC) indicator

Field QC/ provides general information about the level of manual and/or automated quality control (QC) that has been applied to the data, including usage if indicated of time sequence checks and possible usage of the standardized Marine QC (MQC) software. Configuration as in IMMT-5

(<https://www.wmo.int/pages/prog/amp/mmop/documents/IMMT-5-JCOMM-4.pdf>):

- 0 – no QC has been performed on this element
- 1 – QC performed; element appears correct
- 2 – QC performed; element appears inconsistent with other elements
- 3 – QC performed; element appears doubtful
- 4 – QC performed; element appears erroneous
- 5 – QC performed; element changed (possibly to missing) as a result
- 6 – QC flag amended: element flagged by CM as correct (1), but according to MQCS still appears suspect (2-4) or missing (9)
- 7 – QC flag amended: element flagged by CM as changed (5), but according to MQCS still appears suspect (2-4)
- 8 – [reserved]
- 9 – element is missing

Background: For values from formats IMMT0-3, code meanings for values 6-8 have changed multiple times over the course of the IMMT format evolution. For IMMT1-3, values 6-8 were termed 'Reserved'. For IMMT-0, values 7-8 were instead termed "not used." [Note: Field not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

- 26) Q/1 QC indicator for height of clouds
- 27) Q/2 QC indicator for visibility
- 28) Q/3 QC indicator for clouds
- 29) Q/4 QC indicator for wind direction
- 30) Q/5 QC indicator for wind speed
- 31) Q/6 QC indicator for air temperature
- 32) Q/7 QC indicator for dew-point temperature
- 33) Q/8 QC indicator for air pressure
- 34) Q/9 QC indicator for weather
- 35) Q/10 QC indicator for sea surface temperature
- 36) Q/11 QC indicator for period of wind waves or of measured waves
- 37) Q/12 QC indicator for height of wind waves or of measured waves
- 38) Q/13 QC indicator for swell
- 39) Q/14 QC indicator for precipitation
- 40) Q/15 QC indicator for characteristic of pressure tendency
- 41) Q/16 QC indicator for amount of pressure tendency
- 42) Q/17 QC indicator for true direction of ship
- 43) Q/18 QC indicator for ship's average speed
- 44) Q/19 QC indicator for wet-bulb temperature
- 45) Q/20 QC indicator for ship's position

Twenty quality control (QC) indicators applicable to individual fields or field groups (further details are available in Supp. B, Table B3; which also lists additional QC indicators available in IMMT-3/4/5). Configuration as in IMMT-5 (<https://www.wmo.int/pages/prog/amp/mmop/documents/MQCS-7-JCOMM-4.pdf>), indicating QC as applied by the Contributing Member (CM) and/or by the Global Collecting Centres (GCCs). Indicator values include the following:

- 0 -- No quality control (QC) has been performed on this element

- 1 -- QC has been performed; element appears to be correct
- 2 -- QC has been performed; element appears to be inconsistent with other elements
- 3 -- QC has been performed; element appears to be doubtful
- 4 -- QC has been performed; element appears to be erroneous
- 5 -- The value has been changed as a result of QC
- 6 -- The original flag is set "1" (correct) and the value will be classified by MQCS as inconsistent, dubious, erroneous or missing
- 7 -- The original flag is set "5" (amended) and the value will be classified by MQCS as inconsistent, dubious, erroneous or missing
- 8 -- [reserved]
- 9 -- The value of the element is missing

Values 6 and 7 are set when the original flag settings were amended by the GCCs using the Minimum Quality Control Standard (MQCS).

Background: [Note: Fields not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR, plus additional QC indicators available in IMMT-3/-4.]

46) Q/21 MQCS version

Version identification for the Minimum QC Standard (MQCS), with this expanded configuration defined for IMMT-5:

- 1 – MQCS- I (Original version, Feb. 1989): CMM-X
- 2 – MQCS-II (Version 2, March 1997) CMM-XII
- 3 – MQCS-III (Version 3, April 2000) SGMC-VIII
- 4 – MQCS-IV (Version 4, June 2001): JCOMM-I
- 5 – MQCS-V (Version 5, July 2004): ETMC-I
- 6 – MQCS-VI (Version 6, January 2011): JCOMM-III)
- 7 – MQCS-VII (Version 7, June 2012): JCOMM-IV

Background: [Note: Field not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

47) HDG ship's heading

Direction to which the ship's bow is pointing, referenced to true North (001-360°; e.g., 360° = North, 90° = East).

Background: According to IMMT-2/-3/-4 documentation, 0 indicates no movement. However, KNMI has suggested that even if the ship is not moving it always has a heading, and therefore zero should not be reported for *HDG* (in contrast to *COG*). According to the IMMT-5 documentation (<https://www.wmo.int/pages/prog/amp/mmop/documents/IMMT-5-JCOMM-4.pdf>) valid range for heading is 001-360; the indicator for no movement has been removed.

48) COG course over ground

Direction the vessel actually moves over the fixed Earth, referenced to true North (0-360°; e.g., 360° = North, 0 = no movement, 90° = East).

49) SOG speed over ground

Speed the vessel actually moves over the fixed Earth, rounded to the nearest whole knot.

50) SLL maximum height > Summer load line

Maximum height of deck cargo above Summer maximum load line (reference level), rounded to the nearest whole meter.

51) *SLHH* departure of Summer max. load line from actual sea level

Departure of reference level (Summer maximum load line) from actual sea level. Difference to the nearest whole meter (0-99) between the Summer maximum load line and the sea level (water line); positive when the Summer maximum load line is above the level of the sea, and negative if below the water line.

52) *RWD* relative wind direction

Relative wind direction in degrees (1-360°) reported in a clockwise direction off the bow of the ship, using 360° when directly on the bow. *RWD*=0 when wind is calm relative to the deck (platform).

Background: It appears that no guidance currently exists for reporting *RWD* when *D* is reported as "variable, or all directions" (i.e., special code 362). Special code of 361 for calm no longer used in IMMT-5.

53) *RWS* relative wind speed

Reported in either whole knots or whole meters per second (e.g., 10 knots or 5 m/s), with units established by *WI* (C0, field 19). *RWS* is a 3-character field to store values of *RWS* larger than *W* (C0, field 20; if *WI* indicates knots), e.g., *W*=98 knots, *RWS*=101 knots.

Background: Fields added to IMMT-2 for VOSclim. [Note: Fields 147-153 were not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR.]

54) *Q/22* QC indicator for ship's heading

55) *Q/23* QC indicator for course over ground

56) *Q/24* QC indicator for speed over ground

57) *Q/25* QC indicator for maximum height > Summer load line

58) *Q/26* Blank for IMMT-4/5, QC indicator for *S_L* in earlier IMMT versions

59) *Q/27* QC indicator for departure of Summer max. load line from actual sea level

60) *Q/28* QC indicator for relative wind direction

61) *Q/29* QC indicator for relative wind speed

Eight additional quality control indicators applicable to individual fields or field groups from IMMT-3/4/5 (further details are available in Supp. B, Table B3). Indicator values are the same as for C5, fields 26-45.

Background: As from IMMT-4, usage of *Q₂₆* is discontinued, ref. IMMT-4 documentation: "now *Q₂₇* serves as the indicator for both *S_L* and *HH*." [Note: Fields not included in the LMR regular section, thus future work should seek to recover this information for data that were translated into IMMA from LMR, plus additional QC indicators available in IMMT-3/-4/-5.]

62) *RH* relative humidity

63) *RHI* relative humidity indicator

Relative humidity is stored in tenths of a percent. *RHI* shows the reported data precision and whether the *RH* was directly measured or computed according to the following:

- 0 – Relative humidity in tenths of Percentage, measured and originally reported
- 1 – Relative humidity in whole Percentage, measured and originally reported
- 2 – [Reserved]
- 3 – Relative humidity in tenths of Percentage, computed
- 4 – Relative humidity in whole Percentage, computed

64) AWS/ AWS indicator

An indicator of whether or not measurements are made using an automated weather station (AWS):

- 0 – No AWS
- 1 – AWS
- 2 – AWS plus manual observations

65) IMONO IMO number

Seven digit unique ship identification number issued by the International Maritime Organization.

Model quality control (*Mod-qc*) attm (C6)

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=6 for *Mod-qc*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes.

GTS bulletin header fields

3) CCCC collecting centre

4) BUID bulletin ID

These two fields are part of the “abbreviated heading” (WMO 2009), providing product identification for purposes of transmission and communication handling ref., <http://www.nws.noaa.gov/oso/oso1/oso15/oso153/SECC123.htm>). Specifically, *CCCC* is the “international four-letter location indicator of the station or centre originating or compiling the bulletin, as agreed internationally, and published in WMO–No.9, Volume C1, *Catalogue of Meteorological Bulletins*,” and *BUID* provides “data designators” ($T_1T_2A_1A_2ii$; see Background, and WMO 2009 for a detailed description).

Background: Using traditional alphanumeric codes, individual (ship or buoy) reports are transmitted over GTS beginning with the identification group $M_iM_iM_iM_i$ (e.g., *BBXX* or *ZZXX* used to indicate the *SHIP* or *BUOY* code, respectively) and collected together to form the “text” (i.e., content) of a “bulletin” (which when enveloped with an initial line and end-of-message signal constitutes the “message”). The initial information includes an abbreviated heading of the form:

$T_1T_2A_1A_2ii$ *CCCC* *YYGGgg* (*BBB*)

where in the context of marine data (see <http://www.nws.noaa.gov/tg/head.html>):

T_1T_2 : Data type and/or form designators

A_1A_2 : Geographical and/or data type and/or time designators

ii: Used to differentiate two or more bulletins which contain data in the same code, originate from the same geographical area, and have the same originating center.

CCCC: International 4-letter location indicator of the station originating or compiling the bulletin (e.g., *KWBC* = Washington, NOAA)

YYGGgg: International date-time group (*YY*: day of month; *GGgg*: hour and minute)

(*BBB*): (optional) for delayed (*RR_x*) reports, or corrections (*CC_x*) or amendments (*AA_x*) to previously relayed reports

The additional elements YYGGgg and BBB making up the abbreviated heading could potentially be important, but are not presently retained e.g., in the UK Met Office VOSclim data. For example, the BBB information could be important to correct information that was not properly relayed initially, and later in the event errors are made in the decoding of the data (e.g., BBB data are not properly handled) there may be no opportunity to reprocess the data properly if header information is not archived. CCCC information may be important to determine transmission details (e.g., origination from Local Users Terminals for drifting buoy reports), but the significance of any of this information has not been fully determined.

Model comparison elements

5) FBSRC Feedback source

An indicator of whether or not measurements are made using an automated weather station (AWS):

0 – operational

Background: [Note: Any additional values are to be determined, e.g., for use with reanalyses.

- 6) BMP background (bckd.) SLP
- 7) BSWU bckd. wind U-component
- 8) SWU derived wind U-component
- 9) BSWV bckd. wind V-component
- 10) SWV derived wind V-component
- 11) BSAT bckd. air temperature
- 12) BSRH bckd. relative humidity
- 13) SRH (derived) relative humidity
- 14) BSST bckd. SST
- 15) MST model surface type
- 16) MSH model height of surface
- 17) BY bckd. year
- 18) BM bckd. month
- 19) BD bckd. day
- 20) BH bckd. hour
- 21) BFL bckd. forecast length (hours)

Model quality control feedback information.

Background: Upon receipt of each GTS report from a VOS ship or moored/drifting buoy, the UK Real Time Monitoring Centre (RTMC – UK Met Office) appends co-located parameters (and related information) from the Met Office forecast model for six variables—SLP, wind U- and V-components, air temperature, relative humidity, and SST—to a selection (translated into BUFR) of the originally reported GTS data. These augmented ship reports are made available in BUFR format to the VOSclim Data Assembly Center (DAC; at NOAA/NCEI), which converts them into IMMA1 format, including this attachment. [Additional technical notes:

(1) In R2.5 data, BFL was discovered to be subject to a conversion error and should not be used. Additionally, the original BUFR field that provides BFL is in minutes. BFL values for R3.0 have been corrected and are being reported in hours, when available.

(2) For BSRH and SRH, values appeared in the input data at least as high as 107%. While actual RH can't be that high, this raises the question whether the ranges of these model-generated fields should be increased in the future e.g., to

107%. Currently, ICOADS format translation or QC procedures remove any such values outside of the range 0-100%. On the other hand, the width of *MSH* has been expanded in IMMA1 to a 4-character field, since negative values (such as – 152.0 and less than –99) have been detected (plus larger positive values than previously allowed).

(3) *BSST* is translated to SI units at the Met Office using constant 273.15K, whereas a lower-precision 273.1K constant is used for *BSAT*, the only other temperature field presently being made available by the Met Office. To keep its resultant higher precision, *BSST* has been expanded to 5 characters. Explanation from Colin Parrett at the RTMC (28 September 2011):

“As far as I know, the conversions depend on the precision of the received data, using 273.0, 273.1 or 273.15 for 0, 1 or 2 (or more) decimal places. I've enquired with our MetDB Team for confirmation and I'll let you know if things have changed. The background SST does come from a different source, so that might explain the greater precision.”

(4) The referenced encoding constant 273.0 does not appear to apply to the temperature elements currently received from the Met Office, but in the event such data were received in the future a 4-character field configuration like that for *BSAT* would be sufficient (however, to accurately translate temperature data back from Kelvin to °C, it is crucial to know what constant has been used for encoding originally reported °C temperatures to Kelvin for storage in BUFR).]

Ship metadata (*Meta-vos*) attm (C7)

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=6 for *Mod-qc*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes.

Ship metadata elements

3) MDS Metadata source

An indicator of source/provider of the metadata:

0 – WMO Publication No. 47

1 – Center for Ocean-Atmospheric Prediction Studies, Tallahassee, USA

Background: Originally designed to store metadata from WMO publication 47, the attm is also used by other data providers to submit metadata for vessels within their respective datasets.

4) C1M recruiting country

5) OPM type of ship (programme)

- 10 – Selected ships
- 15 – Selected ships (AWS)
- 30 – VOSClim
- 35 – VOSClim (AWS)
- 40 – Supplementary ships
- 45 – Supplementary ships (AWS)
- 70 – Auxiliary ships
- 75 – Auxiliary ships (AWS)
- 99 – Unknown

6) KOV kind of vessel

BA – Barge
 BC – Bulk Carrier
 CA – Cable ship
 CG – Coast Guard Ship
 CS – Container Ship
 DR – Dredger
 FE – Passenger ferries
 FP – Floating production and storage units
 FV – Other Fishing Vessel
 GC – General Cargo
 GT – Gas Tanker
 IC – Icebreaking vessel
 IF – Inshore Fishing Vessel
 LC – Livestock carrier
 LT – Liquid Tanker
 LV – Light Vessel
 MI – Mobile installation including mobile offshore drill ships, jack-up rigs and semi-submersibles
 MS – Military Ship
 OT – Other
 OW – Ocean Weather Ship
 PI – Pipe layer
 PS – Passenger ships and cruise liners
 RF – Ro/Ro Ferry
 RR – Ro/Ro Cargo
 RS – Refrigerated cargo ships including banana ships
 RV – Research Vessel
 SA – Large sailing vessels
 SV – Support Vessel
 TR – Trawler
 TU – Tug
 VC – Vehicle carriers
 YA – Yacht / Pleasure Craft

7) COR country of registry
 Encoding same as *C1M*.

8) TOB type of barometer
 AN – Aneroid barometer (issued by Port Meteorological Officer or Meteorological Agency)
 DA – Digital Aneroid Barometer
 ELE – electronic digital barometer
 MER – Mercury Barometer
 SAN – Ship's Aneroid Barometer
 OT – Other

9) TOT type of thermometer
 ALC – Alcohol Thermometer
 ELE – Electric (resistance) Thermometer
 MER – Dry Bulb Mercury Thermometer

10) *EOT* exposure of thermometer

A – Aspirated (Assmann type)
S – Screen (not ventilated)
HH – Hand-held digital thermometer / humidity sensor
RS – Radiation shield (e.g. cylindrical / Gill multi-plate)
SG – Ship's Sling
SL – Sling
SN – Ship's screen
US – Unscreened
VS – Screen (ventilated)
W – Whirling

11) *LOT* screen location

1 – Bridge wing port
2 – Bridge wing starboard
3 – Bridge wing both sides
4 – Bridge wing windward side
5 – Wheelhouse top port
6 – Wheelhouse top starboard
7 – Wheelhouse top both
8 – Wheelhouse top center
9 – Wheelhouse top windward side
10 – Mainmast
11 – Foremast
12 – Mast on Wheelhouse top
13 – Main deck port side
14 – Main deck starboard side
15 – Main deck both sides
OT – Other (specify in footnote)

12) *TOH* type of hygrometer

1 – Hygristor
2 – Chilled Mirror
3 – Other
C – Capacitance
E – Electric
H – Hair hygrometer
P – Psychrometer
T – Torsion

13) *EOH* exposure of hygrometer

Encoding same as *EOT*.

14) *SIM* SST measurement method

BTT – Bait tanks thermometer
BU – Bucket thermometer
C – Thermometer in condenser intake on steam ships, or inlet engine cooling system on motor ships
HC – Hull contact sensor
HT – “Through hull” sensor
OT – Other

RAD – Radiation thermometer
TT – Trailing thermistor

- 15) LOV length of vessel
- 16) DOS depth of SST measurement
- 17) HOP height of visual observation platform
- 18) HOT height of air temperature sensor
- 19) HOB height of barometer
- 20) HOA height of anemometer

Height and depth elements 15 – 20 are stored to the nearest whole meter.

- 21) SMF source metadata file

WMO Pub. 47 source file for the metadata encoded as 4-digit year and 1-digit quarter (e.g., 19991 = 1st quarter of 1999).

- 22) SME source metadata element

Line number from source file.

- 23) SMV source format version

- 1 – Output from digitization project, semi-colon delimited format (1955)
- 2 – Output from digitization project, semi-colon delimited format (1956)
- 3 – Output from digitization project, semi-colon delimited format (1957 – 1967)
- 4 – Output from digitization project, semi-colon delimited format (1968–69)
- 5 – Fixed format (1970–94)
- 6 – Semicolon delimited format (1995–2001)
- 7 – Semicolon delimited format (2002–2007 q1)
- 8 – Semicolon delimited format (2007 - 2008)
- 9 – Semicolon delimited format (2009 - 2014)

Background: See Kent et. al (2007a) for details on version information.

Fields 4 – 23 contain metadata selected from WMO–No. 47 (1955–) by the UK National Oceanography Centre, Southampton (Kent et al. 2007a, Berry et al. 2009). Some deck 740 (Research Vessel Data Quality-Evaluated by FSU/COAPS) metadata have also been stored in this attachment. Tables defining select field have been reproduced from Berry et al. 2009 (http://icoads.noaa.gov/e-doc/imma/WMO47IMMA_1966_2007-R2.5.pdf).

Background: The codes defined in WMO–No. 47, and used in IMMA, for *OPM* and *SIM* differ from the codes used for the similar fields *OP* and *SI*. Prior to 1995 a 3-digit numeric code was defined in WMO–No. 47 for *C1M*; starting in 1995, WMO–No. 47 adopted the 2-character ISO alphabetic code, which was in 1998 also adopted for IMMT. For *C1M*, the earlier 3-digit numeric codes were transformed by NOCS into the 2-character alphabetic codes.

Near-surface oceanographic data (*Nocn*) attm (C8)

- 1) ATTI attm ID
- 2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=8 for *Nocn*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=102 [2U in base36] for *Nocn*).

Near-surface oceanographic data and metadata elements

3) OTV temperature value

4) OTZ temperature depth

Temperature of water is stored in thousandths of a degree Celsius along with the associated depth of the measurement to the nearest hundredth of a meter.

Background: The SST min. and max. limits in the *Core* (Table C0) are -99.0 to 99.0°C with a precision of 0.1°C, this attachment has greater precision as is appropriate for modern oceanographic profile data, with a max. value based roughly on QC limits from the Global Ocean Surface Underway Data (GOSUD) programme (<http://www.gosud.org>).

5) OSV salinity value

6) OSZ salinity depth

Salinity of water is stored as a unit-less value (commonly known as the practical salinity unit) to the nearest thousandths along with the associated depth of the measurement to the nearest hundredth of a meter.

7) OOV dissolved oxygen value

8) OOZ dissolved oxygen depth

Dissolved oxygen concentration is stored in hundredths of a milliliter per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

9) OPV phosphate value

10) OPZ phosphate depth

Phosphate concentration is stored in hundredths of a micromole per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

11) OSV silicate value

12) OSIZ silicate depth

Silicate concentration is stored in hundredths of a micromole per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

13) ONV nitrate value

14) ONZ nitrate depth

Nitrate concentration is stored in hundredths of a micromole per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

15) OPHV salinity value

16) OPHZ salinity depth

pH of water is stored as a unit-less value to the nearest hundredth along with the associated depth of the measurement to the nearest hundredth of a meter.

17) OCV total chlorophyll value

18) OCZ total chlorophyll depth

Total chlorophyll concentration is stored in hundredths of a microgram per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

19) OAV alkalinity value

20) OAZ alkalinity depth

Alkalinity concentration is stored in hundredths of a milliequivalent per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

21) OPCV partial pressure of carbon dioxide value

22) OPCZ partial pressure of carbon dioxide depth

Partial pressure of carbon dioxide is stored in tenths of a microatmosphere along with the associated depth of the measurement to the nearest hundredth of a meter.

23) ODV dissolved inorganic carbon value

24) ODZ dissolved inorganic carbon depth

Dissolved inorganic carbon concentration is stored in tenths of a micromole per liter along with the associated depth of the measurement to the nearest hundredth of a meter.

25) PUID provider's unique record identification

A unique identifier associated with the record that was assigned by the data provider.

Edited Cloud Report (*Ecr*) attm (C9)

Background: This attm is based on previous work of Carole Hahn. Element descriptions are summarized below. Additional details are provided in Hahn et al. (1995) and Hahn and Warren (1999).

Hahn, C.J. and S.G. Warren, 1999: Extended Edited Synoptic Cloud Reports from Ships and Land Stations Over the Globe, 1952-1996. NDP-026C, Carbon Dioxide Information Analysis Center, Oak Ridge National Laboratory, Oak Ridge, TN, doi:[10.3334/CDIAC/cli.ndp026c](https://doi.org/10.3334/CDIAC/cli.ndp026c).

Hahn, C.J., S.G. Warren and J. London, 1995: The effect of moonlight on observation of cloud cover at night, and application to cloud climatology. *J. Climate*, **8**, 1429-1446, doi: [10.1175/1520-0442\(1995\)008<1429:TEOMOO>2.0.CO;2](https://doi.org/10.1175/1520-0442(1995)008<1429:TEOMOO>2.0.CO;2).

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=9 for *Ecr*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=32 for *Ecr*).

Extended Edited Cloud Report (EECR) basic elements

3) CCe Change code

Indicator of whether the original report was changed (edited) during processing. Code values are defined in Table C9a (and previously in sec. 3.3 of Hahn and Warren [1999]). Table C9b gives definitions of cloud and weather conditions used in Table C9a, for example "fog" or "showers".

Table C9a. Change codes (CCe) and their associated descriptions, cases categorizations, and field changes made (from Table 3 of Hahn and Warren (1999)). The CCe ordering in this table (0-13) also reflects the order in which changes to the cloud fields must be made during processing.

<u>CCe¹</u>	<u>Description</u>	<u>Case</u>	<u>Changes made</u>
0	No changes required		None
1	Cause of N=9 determined from WW Set Ne=8, NHe=8, and He=0	N=9 with precipitation or fog	Ne=8 NHe=8

	<p>If <i>CL</i> missing, then set <i>CLe</i>=0</p> <p>If foggy, then set <i>CLe</i>=11</p> <p>If showers, then set <i>CLe</i>=10</p> <p>If drizzle/rain/snow, then set <i>CMe</i>=10</p>		<p><i>He</i>=0</p> <p><i>CLe</i>=10,11 or <i>CMe</i>=10</p>
2	<p><i>NH</i> is amount of sky covered by medium cloud if no low cloud is present. If <i>NH</i>=0 with <i>CM</i> present and <i>CL</i>=0; then if <i>CH</i> present, set <i>NHe</i> missing else, set <i>NHe</i>=<i>N</i></p>	<p><i>NH</i>=0 with <i>CM</i>>0 and <i>CL</i>=0 and <i>CH</i>≤0</p> <p><i>NH</i>=0 with <i>CM</i>>0 and <i>CL</i>=0 and <i>CH</i>>0</p>	<p><i>NHe</i>=<i>N</i></p> <p><i>NHe</i>=missing</p>
3	<p>If <i>NH</i>=<i>N</i> or missing and only high cloud present, set <i>NHe</i>=0</p>	<p><i>NH</i>=<i>N</i> with <i>CH</i>>0 and <i>CL</i>=<i>CM</i>=0</p>	<p><i>NHe</i>=0</p>
4	<p>If <i>NH</i><<i>N</i> and only low cloud is present, then set <i>NHe</i>=missing</p> <p>If <i>NH</i><<i>N</i> and only mid cloud is present, then set <i>NHe</i>=missing</p> <p>If <i>NH</i>≠<i>N</i> and only high cloud present, set <i>NHe</i>=missing</p>	<p><i>NH</i><<i>N</i> where it should be <i>NH</i>=<i>N</i></p> <p><i>NH</i><<i>N</i> where it should be <i>NH</i>=<i>N</i></p> <p><i>NH</i>≠<i>N</i> with <i>CH</i>>0 and <i>CL</i>=<i>CM</i>=0</p>	<p><i>NHe</i>=missing</p> <p><i>NHe</i>=missing</p> <p><i>NHe</i>=missing</p>
5	<p>If low cloud information (<i>NH</i> or <i>CL</i>) is missing and <i>CM</i> or <i>CH</i> present, then set <i>CMe</i>=<i>CHe</i>=missing</p>	<p><i>CL</i>="/" with <i>CM</i> or <i>CH</i> not "/"</p>	<p><i>CMe</i>,<i>CHe</i>=missing</p>
6	<p>If (<i>N</i>=<i>NH</i>=8 or <i>N</i>=<i>NH</i>=7) and <i>CM</i>=0, then set <i>CMe</i>=missing</p> <p>If (<i>N</i>=<i>NH</i>=8 or <i>N</i>=<i>NH</i>=7) and <i>CH</i>=0, then set <i>CHe</i>=missing</p>	<p><i>CM</i> or <i>CH</i> miscoded as 0</p>	<p><i>CMe</i> or <i>CHe</i>=missing</p>
7	<p>If <i>CM</i>=7 when drizzle/rain/snow, then set <i>CMe</i>=11</p> <p>If <i>CM</i>=2 when drizzle/rain/snow, then set <i>CMe</i>=12</p>	<p><i>CM</i>=7 or 2 identified as <i>Ns</i></p>	<p><i>CMe</i>=11 or 12</p>
8	<p>If drizzle/rain/snow and <i>CM</i> is missing and <i>CL</i> is present; and <i>CL</i>≠1,2,3 or 9; then if either <i>WW</i>≥60 or <i>CL</i>=7 or <i>CL</i>=0; set <i>CMe</i>=10</p>	<p><i>CM</i>="/" for <i>Ns</i></p>	<p><i>CMe</i>=10</p>
9	<p>If <i>CM</i> is missing and both <i>CL</i> and <i>CH</i> present, then set <i>CMe</i>=0</p> <p>If <i>N</i>≤4, <i>N</i>=<i>NH</i>, <i>CL</i> is present, <i>CM</i>=missing, and <i>CCe</i>=0, then <i>CMe</i>=0</p> <p>If <i>N</i>≤4, <i>N</i>=<i>NH</i>, <i>CL</i> is present, <i>CH</i>=missing, and <i>CCe</i>=0, then set <i>CHe</i>=0</p>	<p><i>CM</i> or <i>CH</i> miscoded as "/"</p>	<p><i>CMe</i> or <i>CHe</i>=0</p>
10	<p><i>N</i>=9 not explainable by <i>WW</i></p>		<p>all parameters set missing</p>
11	<p><i>NH</i>><i>N</i></p>		<p>all parameters set missing</p>
12	<p><i>N</i>=0 accompanied by precipitation</p>		<p>all parameters set</p>

13	N>0 and CL=CM=CH=0	missing all parameters set missing
----	--------------------	--

1. Also order in which changes are made, but CCE=9 is recorded only if no previous change occurred (this conflict can occur only with CCE=7 or 8).

Table C9b. Cloud and Weather Type Definitions Used in ECRs (modified from Table 2 of Hahn and Warren (1999)). Note that "/" has been coded in IMMA format as "A", interpreted as "10".

Level	Shorthand notation	Meaning	Synoptic Codes	Extended Codes ¹	Ecr
	TC	Total cloud cover	N = 0-9	Ne=0-8	
	Cr	Completely clear sky	N = 0	Ne=N	
	Ppt	Precipitation	WW= 50-75, 77, 79, 80-99		
	D	Drizzle	50-59		
	R	Rain	60-69		
	S	Snow	70-75, 77, 79		
	Ts	Thunderstorm or Shower	80-99		
Low			CL=		
	Fo	Sky obscured by fog	/ with N=9 and ww=10-12,40-49	CLe=11	
	St	Stratus	6, 7	CLe=CL	
	Sc	Stratocumulus	4, 5, 8	CLe=CL	
	Cu	Cumulus	1, 2	CLe=CL	
	Cb	Cumulonimbus	3, 9, or N=9 with ww=Ts	CLe=CL CLe=10	
Mid			CM =		
	Ns	Nimbostratus	2,7, or N=9 with ww=DRS / with ww=DRS and CL=0,7 / with ww= RS and CL=4-8	CMe=12,11,10 CMe=10 CMe=10	
	As	Altostratus	1; 2 if ww not DRS	CMe=CM	
	Ac	Alto cumulus	3,4,5,6,8,9; 7 if ww not DRS	CMe=CM CMe=CM	
High			CH =		
	Hi	Cirriform clouds	1-9	CHe=CH	

1. In the processing for the extended code both "/" ("A" in IMMA) and missing (blank in IMMA) are treated in the same way.

- 4) WWe present weather
- 5) Ne total cloud amount
- 6) NHe lower cloud amount
- 7) He lower cloud base height
- 8) CLe low cloud type
- 9) CMe middle cloud type
- 10) CHe high cloud type

Weather and cloud variables coded as specified by WMO and as documented in the Core for elements WW, N, NH, H, CL, CM, and CH (C0, fields 23, 36, 37, 40, 38, 41, and 42, respectively) except that CLe and CMe have been "extended" as indicated in Tables C9c and C9d, respectively. Also, cases of N=9 with fog or precipitation have

been converted to N=8 (defined in Table C9b). Any such conversion is recorded in the change code (CCe, Table C9a).

NOTE: An *Ecr* attachment is provided only if N is given in the original report.

Table C9c. Low cloud type (CLe) coding information.

<u>Code</u>	<u>WMO (or EECR) Code</u>	<u>Description</u>
0	Code 0513	no stratocumulus, stratus, cumulus or cumulonimbus
1	Code 0513	cumulus with little vertical extent and seemingly flattened, or ragged cumulus, other than of bad weather, or both
2	Code 0513	cumulus of moderate or strong vertical extent, generally with protuberances in the form of domes or towers, either accompanied or not by other cumulus or stratocumulus, all having bases at the same level
3	Code 0513	cumulonimbus, the summits of which, at least partially, lack sharp outlines but are neither clearly fibrous (cirriform) nor in the form of an anvil; cumulus, stratocumulus or stratus may also be present
4	Code 0513	stratocumulus formed by the spreading out of cumulus; cumulus may also be present
5	Code 0513	stratocumulus not resulting from the spreading out of cumulus
6	Code 0513	stratus in a more or less continuous layer, or in ragged shreds, or both but no stratus fractus of bad weather
7	Code 0513	stratus fractus of bad weather or cumulus fractus of bad weather, or both (pannus), usually below altostratus or nimbostratus
8	Code 0513	cumulus and stratocumulus other than that formed from the spreading out of cumulus; the base of the cumulus is at a different level from that of the stratocumulus
9	Code 0513	cumulonimbus, the upper part of which is clearly fibrous (cirriform) often in the form of an anvil; either accompanied or not by cumulonimbus without anvil or fibrous upper part, by cumulus, stratocumulus, stratus or pannus
10	(EECR code)	cumulonimbus, identified from sky obscured (N=9) accompanied by showery precipitation or thunderstorm (WW≥80)
11	(EECR code)	fog, identified from sky obscured (N=9) accompanied by WW indicating fog (WW=10-12 or 40-49)

Table C9d. Medium cloud type (CMe) coding information.

<u>Code</u>	<u>WMO (or EECR) Code</u>	<u>Description</u>
0	Code 0515	no altocumulus, altostratus or nimbostratus
1	Code 0515	altostratus, the greater part of which is semi-transparent; through this part the sun or moon may be weakly visible, as through ground glass
2	(EECR code)	altostratus, the greater part of which is sufficiently dense to hide the sun or moon
3	Code 0515	altocumulus, the greater part of which is semi-transparent; the various elements of the cloud change only slowly and are all at a single level
4	Code 0515	patches (often in the form of almonds or fish) of altocumulus, the greater part of which is semi-transparent; the clouds occur at one or more levels and the elements are continually changing in appearance
5	Code 0515	semi-transparent altocumulus in bands, or altocumulus, in one or more continuous layer (semi-transparent or opaque), progressively invading the sky; these generally thicken as a whole

6	Code 0515	altocumulus resulting from the spreading out of cumulus or cumulonimbus
7	(EECR code)	altocumulus in two or more layers, usually opaque in places, and not progressively invading the sky; or opaque layer of altocumulus, not progressively invading the sky; or altocumulus together with altostratus
8	Code 0515	altocumulus with sproutings in the form of small towers or battlements, or altocumulus having the appearance of cumuliform tufts
9	Code 0515	altocumulus of a chaotic sky, generally at several levels
10	(EECR code)	nimbostratus, identified from sky obscured ($N=9$) accompanied by drizzle, or non-showery precipitation
11	(EECR code)	nimbostratus, identified from $CM=7$ accompanied by WW indicating rain
12	(EECR code)	nimbostratus, identified from $CM=2$ accompanied by WW indicating rain

EECR derived cloud elements

11) AM middle cloud amount

12) AH high cloud amount

These variables give the "actual" amounts of middle and high clouds, derived from N and NH with use of the random overlap equation, if necessary (see sec. 3.5 of Hahn and Warren [1999]).

13) UM NOL middle amount

14) UH NOL high amount

These variables, derived from N and NH , give the "non-overlapped" (NOL) amounts of middle and high clouds; i.e., the amounts visible from below (see sec. 3.5 of Hahn and Warren [1999]).

EECR sky brightness elements

15) SBI sky-brightness indicator

The sky-brightness indicator has a value of "1" (light) if the illuminance criterion described in Hahn et al. (1995) was satisfied at the time and place of the report, suggesting that there was adequate light for visual observation of cloud cover and cloud types (if not, then $SBI=0$; dark). This variable can be used in lieu of SA and RI if one accepts the criterion recommended in Hahn et al. (1995).

16) SA solar altitude

17) RI relative lunar illuminance

The solar and lunar parameters needed to determine the illuminance provided by the sun or moon for the date, time and location of the report (see sec. 3.6 of Hahn and Warren (1999)). SA is the altitude of the sun above the horizon. RI is the relative lunar illuminance, defined in Hahn et al. (1995), which depends on the lunar altitude and phase, and the earth-moon distance. The illuminance criterion of Hahn et al. (1995) is satisfied ($SBI=1$) when $SA \geq -9^\circ$ or $RI > 0.11$. A negative value of RI means the moon was below the horizon.

Reanalysis QC/feedback (*Rean-qc*) attm (C95)

1) $ATTI$ attm ID

2) $ATTL$ attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=95 for *Rean-qc*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=61 for *Rean-qc*).

Reanalysis QC/feedback data and metadata elements

3) *ICNR* Input component number-*Rean-qc*

Component within the IMMA record for which the reanalysis QC/feedback applies (e.g., 0=*Core* or appropriate *ATTI* for other attm).

4) *FNR* Field number – *Rean-qc*

Field number from the referenced IMMA component (*ICNR*) for which the reanalysis QC/feedback applies (e.g., for sea temperature in the *Core*, *FNR* = 35 and for sea temperature from the *Nocn*, *FNR* = 3).

5) *DPRO* Data provider – reanalysis: lead organization

An indicator of lead organization providing the QC/feedback:

- 1 – ECMWF
- 2 – NOAA-NCEP
- 3 – NASA
- 4 – JMA

6) *DPRP* Data provider – reanalysis: project

An indicator of the project providing the QC/feedback:

- 1 – ERA-20C
- 2 – CFSRv2
- 3 – MERRA
- 4 – JRA-55

7) *UFR* Usage flag - reanalysis

An indicator of whether or not the record was used in the reanalysis:

- 1 – Assimilated and used
- 2 – Assimilated and rejected
- 3 – Blacklisted
- 4 – Whitelisted
- 5 – Available but not used
- 6 – None apply

Background: Blacklisted records (*UFR*=3) are determined *a priori* to be erroneous and are not used. Whitelisted records (*UFR*=4) are determined *a priori* to be used regardless of assimilation assessment.

8) *MFGR* Model-located first guess value/representative value in case of ensemble methods

Value of model-located first guess or a representative value in case ensemble methods are used.

Background: The range of minimum and maximum values, numeric precision, and units of measurement are all inherited from *ICNR* & *FNR*, with numerical precision increased by one (additional) position right of the decimal to better accommodate numerical precision used in the assimilation process. For example, *ICNR*=0 and *FNR*=29 refer to *AT*, which can range from –99.9 to 99.9, with precision and units of 0.1°C. Thus feedbacks on *AT* stored in this attm in *MFGR*, *MAR* and *BCR* have precision increased to 0.01°C, with range –99.99 to 99.99.

9) MFGSR Model-located first guess spread

Spread of model-located first guess. This is an optional field only used in the case of ensemble reanalyses.

10) MAR Model-located analysis value/representative value in case of ensemble methods

Model-located analysis value or a representative value in case ensemble methods are used.

Background: The range of minimum and maximum values, numeric precision, and units of measurement are all inherited from *ICNR* & *FNR*, with numerical precision increased by one (additional) position right of the decimal to better accommodate numerical precision used in the assimilation process. For example, *ICNR*=0 and *FNR*=29 refer to *AT*, which can range from –99.9 to 99.9, with precision and units of 0.1°C. Thus feedbacks on *AT* stored in this attm in *MFGSR*, *MAR* and *BCR* have precision increased to 0.01°C, with range –99.99 to 99.99.

11) MASR Model-located analysis spread

Spread of model-located analysis value. This is an optional field only used in the case of ensemble reanalyses.

12) BCR Bias corrected value

Bias corrected value from model.

Background: The range of minimum and maximum values, numeric precision, and units of measurement are all inherited from *ICNR* & *FNR*, with numerical precision increased by one (additional) position right of the decimal to better accommodate numerical precision used in the assimilation process. For example, *ICNR*=0 and *FNR*=29 refer to *AT*, which can range from –99.9 to 99.9, with precision and units of 0.1°C. Thus feedbacks on *AT* stored in this attm in *MFGSR*, *MAR* and *BCR* have precision increased to 0.01°C, with range –99.99 to 99.99.

13) ARCR Author reference code – *Rean-qc*

The author reference code is an optional alphanumeric value that is intended to point to a publication or technical report describing the reanalysis QC/feedback provided in the *Rean-qc* attm. The following *ARCR* has been assigned:

PH13 – ERA-20C, 2013 (Poli, P., H. Hersbach, D. Tan, D. Dee, J.-N. Thépaut, A. Simmons, C. Peubey, P. Laloyaux, T. Komori, P. Berrisford, R. Dragani, Y. Trémolet, E. Holm, M. Bonavita, L. Isaksen and M. Fisher, 2013: The data assimilation system and initial performance evaluation of the ECMWF pilot reanalysis of the 20th-century assimilating surface observations only (ERA-20C). ERA Report Series no. 14, ECMWF, 59 pp.

14) CDR Creation date – *Rean-qc*

Date conforming to ISO 8601 (YYYYMMDD) that identifies when the reanalysis QC/feedback for the given record was created. Set by the external developer that produced the *Rean-qc* attm.

15) ASIR Access status indicator – *Rean-qc*

An indicator of the status of the access to the record within ICOADS, such that only active records are still available within ICOADS:

- 0 – Active
- 1 – Inactive

ICODS Value-Added Database (*Ivad*) attm (C96)

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=96 for *Ivad*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=53 for *Ivad*).

ICODS value-added data and metadata elements

3) ICNI Input component number-*Ivad*

Component within the IMMA record for which the value-added data, uncertainties, and/or quality control applies (e.g., 0=Core or appropriate *ATTI* for other attm).

4) FNI Field number – *Ivad*

Field number from the referenced IMMA component (*ICNI*) for which the value-added data, uncertainties, and/or quality control applies (e.g., for sea temperature in the Core, *FNI* = 35 and for sea temperature from the *Nocn*, *FNI* = 3).

5) JVAD Scaling factor for *VAD*

Scaling factor applied to convert “*FVAD*,” an input floating-point value, into *VAD* (i.e., representing also *VAU1*, *VAU2*, or *VAU3*) according to $VAD = FVAD \times 10^{JVAD}$. Then the original un-scaled value is reconstructed according to $FVAD = VAD \times 10^{-JVAD}$.

[Note: Future versions of IMMA may lower the max to a value more likely to be realistic considering current data characteristics, e.g., 5 (i.e., scaling factor max becomes 10^5 , thus again taking the *AT* case numeric precision of *FVAD* becomes 0.00001°C).]

6) VAD Value-added data value

Adjusted data value (e.g., bias-corrected) associated with field defined by *ICNI* and *FNI*.

Background: The adjusted value will be stored in this *Ivad* attm, whereas the unadjusted data will be stored in the Core/other attms as noted by *ICNI* and *FNI*. *VAD* units are inherited from *ICNI* and *FNI* (e.g., *ICNI*=0 and *FNI*=29 refer to *AT*, which has units of °C); the scaled range and the numeric precision is determined (e.g., at run time by {*rwimma1*}) from the scaling factor (e.g., taking the *AT* case: *JVAD*=0 yields whole °C, *JVAD*=1 yields 0.1°C, *JVAD*=2 yields 0.01°C, etc.). [Note that the storage of the adjusted value in this attm is an inversion of the planned handling, after blending into ICODES, of straightforward data corrections using the *Error* attm (see Table C97).]

7) IVAU1 Type indicator for *VAU1*

8) JVAU1 Scaling factor for *VAU1*

9) VAU1 Uncertainty of type *IVAU1*

10) IVAU2 Type indicator for *VAU2*

11) JVAU2 Scaling factor for *VAU2*

12) VAU2 Uncertainty of type *IVAU2*

13) IVAU3 Type indicator for *VAU3*

14) JVAU3 Scaling factor for *VAU3*

15) VAU3 Uncertainty of type *IVAU3*

Indicators *IVAUI1*, *IVAUI2*, *IVAUI3* defined the type of uncertainty provided:

- 0 – To be determined in prototype
- 1 – To be determined in prototype

Scale factor *JVAUI1*, *JVAUI2*, *JVAUI3* for *VAUI1*, *VAUI2*, *VAUI3*, respectively, and defined identically to *JVAD*.

Uncertainty, *VAUI1*, *VAUI2*, and *VAUI3*, associated with field defined by *ICNI* and *FNI*.

Background: Uncertainty value units are inherited from *ICNI* and *FNI* (e.g., *ICNI*=0 and *FNI*=29 refer to *AT*, which has units of °C); the scaled range is as specified, and the numeric precision is determined (e.g., at run time by {*rwimma1*}) from the scaling factor (e.g., taking the *AT* case: *JVAUI1*=0 yields whole °C, *JVAUI1*=1 yields 0.1°C, *JVAUI1*=2 yields 0.01°C, etc.).

16) *VQC* Value-added quality control flag

The *VQC* is designed to store externally derived and provided data QC information. The provider of QC information is required to map their flags to the *VQC* configuration (Table C96a) and describe their mapping method in external documentation as linked via *ARC* (also original QC flags, prior to mapping to *VQC*, can be stored in the *Suppl* attm together with original data).

Table C96a. Configuration of the value-added QC Flag (*VQC*), following primary-level quality flag (QF) codes and definitions from IOC (2013)¹, which also recommends that any QC tests must be well documented in metadata that accompany the data.

<i>Code</i>	<i>Primary level flag's short name</i>	<i>Definition</i>
1	Good	passed documented required QC tests
2 ²	Not evaluated, not available or unknown	used for data when no QC test performed or the information on quality is not available
3	Questionable/suspect	failed non-critical documented metric or subjective test(s)
4	Bad	failed critical documented QC test(s) or as assigned by the data producer
9	Missing data	used as placeholder when data are missing

1. IOC, 2013: Ocean Data Standards, Vol. 3: Recommendation for a Quality Flag Scheme for the Exchange of Oceanographic and Marine Meteorological Data. IOC Manuals and Guides 54, Vol. 3., 12 pp. (English.)(IOC/2013/MG/54-3).

[http://www.iode.org/index.php?option=com_oe&task=viewDocumentRecord&docID=10762].

2. Explanation for the placement of flag value 2, from IOC (2013): 'The quality of verified "Good" (flag 1) is considered higher (smaller flag value) compared to "Not evaluated" (flag 2), as the latter could turn out to be of any quality from good to bad, once the quality checks have been performed. Consequently, the neutral "Not evaluated" (flag 2) is placed between verified "Good" and verified "Questionable/suspect".'

17) *ARCI* Author reference code – *Ivad*

The author reference code is a required alphanumeric value that is intended to direct the user to a publication or technical report describing value-added data, uncertainties, and/or quality control provided in the *Ivad* attm. The *ARCI* values defined for the *IVAD* prototype are the following:

- BKT – National Oceanography Center, Berry, Kent, and Taylor, created 2015
- FS01 – Florida State University, Smith et al. 2015

18) *CDI* Creation date – *Ivad*

Date conforming to ISO 8601 (YYYYMMDD) that identifies when the value-added data, uncertainties, and/or quality control for the given record was created. Set by the external developer that produced the *lvad* attm.

19) *ASII* Access status indicator – *lvad*

An indicator of the status of the access to the *lvad* record within ICOADS:

- 0 – Active
- 1 – Inactive

Error (*Error*) attm (C97)

1) *ATTI* attm ID

2) *ATTL* attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=97 for *Error*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=32 for *Error*).

Corrected erroneous data and metadata elements

3) *ICNE* Input component number-*Error*

Component within the IMMA record for which corrected erroneous data or metadata applies (e.g., 0=*Core* or appropriate *ATTI* for other attm).

4) *FNE* Field number – *Error*

Field number from the referenced IMMA component (*ICNE*) for which the error correction applies (e.g., for sea temperature in the *Core*, *FNE* = 35 and for sea temperature from the *Nocn*, *FNE* = 3).

5) *CEF* Corrected or erroneous field flag

An indicator of whether or not the *ERRD* field contains the corrected or uncorrected value.

- 0 - *ERRD* is the corrected value
- 1 - *ERRD* is the uncorrected value

Background: It is envisioned that when external providers submit *Error* attm, they will provide the corrected value in the attm and set *CEF*=0. To simplify the user interface, corrections for straightforward errors (e.g., callsign garbling) will ultimately be stored by ICOADS in the *Core*/other attms, whereas uncorrected data will be stored in this *Error* attm—this is an inversion of the planned handling of bias adjustments using the *lvad* attm. The swapping of the information from externally provided *Error* attms, to final inverted storage in IMMA1 (i.e., from *CEF*=0 to *CEF*=1, and interchanging the data fields), will likely be handled by the ICOADS data team at NCEI; however, the *CEF* flag settings should allow this inversion to be handled externally instead if desired (i.e., through the provision of both Main and Subsidiary records).

6) *ERRD* Corrected or uncorrected value

Adjusted data value (e.g., bias-corrected) associated with field defined by *ICNE* and *FNE*.

Background: The numeric precision and units of measurement are inherited from *ICNE* and *FNE*. [Note: In {*rwimma1*}, the *Min.* and *Max.* of *ERRD* are initialized to character (i.e., “c” and “c”) but these values are changed to “(inh.)” after *ICNE*

and *FNE* are known. Moreover, all fields are right-justified, e.g., *ID* is left-justified in *ERRD* characters two through ten.]

7) *ARCE* Author reference code – *Error*

The author reference code is a required alphanumeric value that is intended to direct the user to a publication or technical report describing error correction provided in the *Error* attm. At the time of R3.0, no *Error* attm had been created.

8) *CDE* Creation date – *Error*

Date conforming to ISO 8601 (YYYYMMDD) that identifies when the error correction for the given record was created. Set by the external developer that produced the *Error* attm.

9) *ASIE* Access status indicator – *Error*

An indicator of the status of the access to the *Error* record within ICOADS:

- 0 – Active
- 1 – Inactive

Unique report identifier (*Uida*) attm (C98)

1) *ATTI* attm ID

2) *ATTL* attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=98 for *Uida*), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=15 for *Uida*).

Report elements

3) *UID* Unique report identifier (ID)

A unique ID for each record in ICOADS represented as a base36 number of length 6. Development considerations for *UID* are discussed in Annex B of Woodruff et al. (2015; <http://icoads.noaa.gov/ivad/IMMA-Rev.pdf>).

Background: The *intermediate* Release 2.5 product ($R_{2.5i}$), containing available duplicates and other reports excluded from the normal user product ($R_{2.5}$), was used as the starting point for assigning *UID*. $R_{2.5i}$ contains ~295M (specifically: 294,725,525) reports ($m_{R_{2.5i}}$), so all those records (in predefined temporal archive sequence) had *UID* assigned from $1, \dots, m_{R_{2.5i}}$. During preparation of R3.0, new and historical records are numbered starting from $m_{R_{2.5i}}+1$. After blending the old and new records into Release 3.0, all the *UID*s will no longer be sequential (i.e., new *UID*s will be interleaved into the old purely numeric sequence; see <http://icoads.noaa.gov/ivad/IMMA-Rev.pdf> for further discussion).

While *UID* is a base36 number, this field is handled by {*rwimma1*} as strictly (i.e., without leading spaces, e.g., 35=00000Z) alphanumeric, and thus is not fully translated into an integer or floating-point (REAL) number (ref. {*rwimma1*} comments: "For character [...] fields, note that ITRUE and FTRUE contain the ICHAR of the first character of the field..."). Separate from {*rwimma1*} however, this Fortran library is available to transform *UID* into an integer (and vice versa): <http://icoads.noaa.gov/software/base36.f>. Users interested in handling *UID* as a number should be aware of possible finite precision issues arising in the representation of large numbers on computers:

- In the integer case, the largest 6-character base36 number is ZZZZZZ (2,176,782,335); however, if one bit is reserved for sign, the largest

positive integer representable in 32 bits is only $2^{31}-1$ (2,147,483,647; ZIK0ZJ in base36). However as noted below the current maximum of *UID* is $m_{R2.5i}$ (~295M) and thus well below this threshold.

- Whereas, in the floating-point case it is not even possible to accurately represent $m_{R2.5i}$ as a 32-bit single precision REAL number.

5) *RN1* Release number: primary

6) *RN2* Release number: secondary

7) *RN3* Release number: tertiary

Three elements that make up the full release number associated with the record. For example, Release 3.0.0 (1662-2014) is represented with *RN1*=3, *RN2*=0, and *RN3*=0, and R3.0.1 (the 2015-forward GTS blend product, providing a NRT preliminary extension to R3.0) with *RN1*=3, *RN2*=0, and *RN3*=1

Background: A uniform policy on the usage of these Release number digits has yet to be developed, but the primary number is envisioned to change only at major full-period Releases, the secondary number at noteworthy incremental Releases, and the tertiary number can describe subsequent Releases associated with a major or incremental Releases (e.g., R3.0.1, R3.1.1).

8) *RSA* Release status indicator

An indicator that specifies whether the record is

- 0 – Preliminary (Not yet included in an official ICOADS Release)
- 1 – Auxiliary (Records provided in separate data files in addition to ICOADS official Releases and Preliminary data. This also includes new data sources received, but awaiting blending into an official ICOADS Release)
- 2 – Full (A record included in an official ICOADS Release)

9) *IRF* Intermediate reject flag

A flag assigned during processing of a release to indicate whether each report is to be rejected or retained during construction, from the Total output dataset, of the Final user dataset, and also flagging the potential construction of an Intermediate dataset (note: not implemented presently for R3.0, only the Total and Final datasets are available). Values are:

- 0 – Intermediate (i.e. Retain in Intermediate data file, reject from Final dataset)
- 1 – Final (i.e. Retain in both Intermediate and Final datasets)
- 2 – Reject (i.e. Reject from both Intermediate and Final datasets)

Supplemental data (*Suppl*) attm (C99)

1) *ATTI* attm ID

2) *ATTL* attm length

3) *ATTE* attm data encoding

5) *SUPD* supplemental data

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents, and *ATTL* was allocated (but is presently unused, see below) to provide the total length of the attm (including *ATTI* and *ATTL*) in bytes, or zero for length unspecified (record terminated by the ASCII line feed character; line feed not counted as part of *ATTL*; note all IMMA data from R3.0 currently follow this form). The supplemental data attm (C99) also includes *ATTE*, which indicates whether the supplemental data that follow are in ASCII or encoded:

missing – ASCII

- 0 – base64 encoding
- 1 – hexadecimal

The {rwimma1} software tests to determine if each individual IMMA record is properly configured, without checking *ATTC* (ref. Table C0) against the number of attachments present. Also, {rwimma1} sets *ATTC* when an IMMA is written, and it allows duplicate attms (i.e., two attms with the same *ATTI*) to appear in a record, but the second overwrites the first (i.e., in memory) unless they are one of the two-dimensional (i.e., *Rean-qc*, *Ivad*, *Error*) attms. The software does not require that attachments appear in any particular order by *ATTI*, with one exception: the supplemental data attm must be the final attm within the record with *ATTL*=0.

Background: Thus far, *ATTL* in bytes has not been supported in the read/write IMMA programs (e.g., {rwimma1}). Also thus far, *ATTE*=1 (hexadecimal) has been used only for MORMET (deck 732) data (to represent binary input). This printable representation, which {rwimma1} treats identically to ASCII, was undocumented in previously available (i.e., IMMA0) Suppl. D information. In addition, while the *ATTE*=0 (base64 encoding; unprintable) representation is documented in Suppl. D, currently it is unused and not fully implemented in {rwimma1}.

Supplement E: ICOADS Release 3.0 IMMA Status

This supplement provides additional technical information on the IMMA1 implementation presently used for Release 3.0 (R3.0.0; 1662-2014), plus for monthly “preliminary” data (based on a blend of NCEP and NCEI GTS receipts) extending ICOADS to near-current dates (R3.0.1; 2015-forward). Also discussed are “total” output datasets derived during the creation of R3.0 that some users may wish to access.

New to R3.0 is the implementation of the IMMA1 linked report format, which includes Main and (optional) Subsidiary records, linked together by the unique record identifier (stored in the *Uida* attm). From this approach, the main records may include:

Main IMMA record: Core + Icoads + Immt + Mod-qc + Meta-vos + Noen + Ecr + Uida + Suppl

which contains (if all attms are present) 542 characters prior to the variable-length *Suppl*. However, the attachment structure of IMMA (and {rwimma1} software) is designed with the capability to save space through omission of empty attachments (i.e., information not relevant, or not available, for a given dataset). Since we utilize this feature for the main ICOADS records, they may frequently be shorter than 510 characters (e.g. the *Meta-vos* and *Ecr* attms in general are only available for VOS data).

During development of R3.0, ICOADS developed a method to blend GTS data streams from NCEI and NCEP, which will support the near-real-time (NRT) extension of R3.0 from January 2015 to present (updated monthly, up to five days into the next month, and referred to as R3.0.1). In 2007 NCEP began masking all ship call signs, and this product recovers up to 70% of the REAL call signs by blending the NCEI stream. Additionally, approximately 5% unique reports are gained from the merge. More information on this product can be found at <http://icoads.noaa.gov/merge.html>.

Also available to the user community will be the newly created “total” datasets. These files include available duplicates and landlocked reports, flagged so that they could be readily removed when creating the “final” R3.0 user product. This file additionally contains records that were rejected during the initial processing because these data had known and documented errors. R3.0 contains a number of known unresolved inhomogeneities and data mixture problems (Freeman et al. 2016; <http://icoads.noaa.gov/r3.html>). Particularly for some of the data mixture issues, the total product is available for further study or potentially to develop improved solutions.

For example, WMO–No. 47 (1955–) metadata (Berry et al. 2009) were blended into the total product, partly in recognition that in some cases only duplicates not selected for final output received the metadata (e.g., due to the lack of a ship callsign in duplicates selected for final output). Another incompletely resolved R3.0 issue for which the total file could be utilized concerns the VOSclim data and metadata, which have not yet been practical to provide in the form of a fully merged dataset (e.g., possibly bringing elements from the GTS and logbook reports, together with the Table C6 (*Mod-qc* attm) feedback information, into composited reports).

Following the release of R3.0.0 in June 2016, enhancements of R3.0 are planned as resources permit. Most immediately, we plan to add *Rean-qc* attms from at least one reanalysis project, and *Ivad* attms from the pilot IVAD project. Longer-term, quality

control improvements and other enhancements to ICOADS are needed as soon as practical (as discussed further in Freeman et al. 2016).

Supplement F: Proposed IMMA Attachments

This supplement contains IMMA attachments that are proposed or in development. None of these attachments have been implemented in IMMA1 or in {rwimma1}. Notes related to the proposed attm development are included below each table, with specific fields in the proposed *Hist* attachment fleshed out in additional detail below Table CP5.

Table CP1. Automated instrumentation (*Auto*) attm (proposed)

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	ATTI	attm ID			Note: set ATTI=(<i>tbd</i>)
2	2	ATTL	attm length			Note: set ATTL=41
Automated instrumental metadata (37 characters):						
3	8	ALAT	latitude	−90.000	90.000	0.001°N
4	9	ALON	longitude	0.000	359.999	0.001°E (ICOADS conv.)
5	1	INAV	navigation system indicator	0	9	(controlled vocabulary <i>tbd</i> , e.g., 0=GPS, 1=POSMV, 2=INS)
6	6	APRS	atmospheric pressure	870.00	1074.60	at barometer height (<i>HOB</i>)
7	6	ARSW	shortwave radiation	0.00	1600.00	Wm ^{−2}
8	1	IARSW	shortwave radiation indicator	0	9	(controlled vocabulary <i>tbd</i> , e.g., 0=down-, 1=upwelling)
9	5	ARLW	longwave radiation	200.00?	800.00?	Wm ^{−2}
10	1	IARLW	longwave radiation indicator	0	9	(controlled vocabulary <i>tbd</i> , e.g., 0=down-, 1=upwelling)

Auto attm notes:

This attm is designed to provide a location to capture meteorological and underway ocean data that are not routinely reported by VOS or in historical ship reports. These values would be derived from automated instrumentation.

This attm could be expanded to include all possible parameters that could be derived at high precision from automated instrumentation. Candidate fields that are included elsewhere in IMMA0 are: Ship's course and speed (*DS/VS*, in the *Core*; or *COG/SOG* for the over ground elements, in *Immt*), and ship's heading (*HDG* in *Immt*), wind direction and speed (true *D/W*, in the *Core*; or relative *RWD/RWS* in *Immt*), *AT*, *WBT*, *DPT* (*Core*), and *RH* and precipitation (*Immt*). Other possible fields for this table include visibility and cloud height derived from automated sensors, but they are currently very rare on ships or moorings, or possibly surface velocity data (not presently part of ICOADS).

For *ARSW*, it is still not determined if the field should allow for negative values. They are common due to sensor calibration issues (and flagged e.g., by *SAMOS*), but are not physical.

Storing *APRS* is proposed for two reasons (a) there is no place in IMMA to store atmospheric pressure values not converted to sea level and (b) precision automated barometers can easily record *SLP* (or *APRS*) to 2 or 3 decimal places. However, if the field serves two purposes, an associated indicator may be needed to flag the high-resolution pressure type (i.e., *SLP* or *APRS*).

Radiation could be handled in different ways. The idea above provides for separate shortwave/longwave total radiation variables. If we added a signed range, this could also allow for net radiation. Another other option would allow for multiple radiation values each with an indicator stating whether it is shortwave, longwave, *PAR*, *UV*, etc. This may result in a variable-length

attachment or one of fixed-length with many empty fields. Also, some indicator of the time period over which the radiation was integrated may be needed. The draft E-SURFMAR Dataformat#100 (http://esurfmar.meteo.fr/doc/o/vos/E-SURFMAR_VOS_formats_v011.pdf) suggests “over the past hour.”

Table CP2. Near-surface oceanographic QC (*Nocq*) attm (proposed).

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	ATTI	attm ID			Note: set ATTI=(tbd)
2	2	ATTL	attm length			Note: set ATTL=28
Near-surface oceanographic QC and calibration information (24 characters):						
1	1	OQCI	quality control indic. ¹	0	9	(Same as QCI in Table C5)
2	1	OQCFL	QC flag list ²	u	u	(tbd)
3	1	OTQC	OTV (temp.) QC flag	0	9	(tbd)
4	1	OTCI	OTV calibration indic.	0	9?	(tbd) ³
5	1	OSQC	OSV (salinity) QC flag	0	9	(tbd)
6	1	OSCI	OSV calibration indic.	0	9?	(tbd)
7	1	OOQC	OOV (oxygen) QC flag	0	9	(tbd)
8	1	OOCI	OOV calibration indic.	0	9?	(tbd)
9	1	OPQC	OPV (phosphate) QC flag	0	9	(tbd)
10	1	OPCI	OPV calibration indic.	0	9?	(tbd)
11	1	OSIQC	OSIV (silicate) QC flag	0	9	(tbd)
12	1	OSICI	OSIV calibration indic.	0	9?	(tbd)
13	1	ONQC	ONV (nitrate) QC flag	0	9	(tbd)
14	1	ONCI	ONV calibration indic.	0	9?	(tbd)
15	1	OPHQC	OPHV (pH) QC flag	0	9	(tbd)
16	1	OPHCI	OPHV calibration indic.	0	9?	(tbd)
17	1	OCQC	OCV (total chlor.) QC flag	0	9	(tbd)
18	1	OCCI	OCV calibration indic.	0	9?	(tbd)
19	1	OAQC	OAV (alkalinity) QC flag	0	9	(tbd)
20	1	OACI	OAV calibration indic.	0	9?	(tbd)
21	1	OPCQC	OPCV (PaCO ₂) QC flag	0	9	(tbd)
22	1	OPCCI	OPCV calibration indic.	0	9?	(tbd)
23	1	ODQC	ODV (DIC) QC flag	0	9	(tbd)
24	1	ODCCI	ODV indic.	0	9?	(tbd)

1. Proposed as an overall QC method flag, the same as QCI in the *Immt* attm, which has this configuration:

- 0 - No quality control (QC)
- 1 - Manual QC only
- 2 - Automated QC only /MQC (no time-sequence checks)
- 3 - Automated QC only (inc. time sequence checks)
- 4 - Manual and automated QC (superficial; no automated time-sequence checks)
- 5 - Manual and automated QC (superficial; including time-sequence checks)
- 6 - Manual and automated QC (intensive, including automated time-sequence checks)
- 7 & 8 - Not used
- 9 - National system of QC (information to be furnished to WMO)

2. Proposed indicator that points to different QC flag schemes (e.g., the ODS-based scheme as listed in Table C96a).
3. As agreed at the April 2013 UK EarthTemp meetings, it appears we need at least 4 configurations: (0) not calibrated, (1) calibrated, (2) bottle calibrated, (3) others.

Nocq attm notes:

QC flags and calibration information paralleling the data value (and accompanying depth) fields in the *Nocn* attm (Table C8).

Table CP3. Alternative QC (Alt-qc) attm (proposed).

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	<i>ATTI</i>	attm ID			Note: set <i>ATTI</i> =(<i>tb</i> d)
2	2	<i>ATTL</i>	attm length			Note: set <i>ATTL</i> =18
Alternative QC information (14 characters):						
3	2	<i>ICNQ</i>	input component number– <i>Alt-qc</i>	0	(<i>tb</i> d)	IMMA component number
4	6	<i>FNQ</i>	field number– <i>Alt-qc</i>	1	(<i>tb</i> d)	IMMA field no. within <i>ICNQ</i>
5	1	<i>AQCFL</i> ¹	QC flag list	u	u	(<i>tb</i> d; possibly [b36])
6	1	<i>QCFV</i>	QC flag value	0	9	(<i>tb</i> d; possibly [b36])
7	4	<i>ARCQ</i>	author reference code– <i>Alt-qc</i>	b	b	(alphanumeric)

1. See *OQCFL* in the *Nocq* attm (Table CP2).

Alt-qc attm notes:

Envisioned as a means by which data providers could provide QC flag information on a flexible basis, akin to the *Error* attm, but for additional quality control flags for any field number in any attm. The intent of the QC flag list is to allow users to submit data using a range of QC flagging schemes (e.g., 0-9, A-Z, etc). This could be supported by using base36 representation. May also want to consider need for length>1 for the *QCFV*.

Table CP4. Platform tracking (Track) attm (proposed).

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	<i>ATTI</i>	attm ID			Note: set <i>ATTI</i> =(<i>tb</i> d)
2	2	<i>ATTL</i>	attm length			Note: set <i>ATTL</i> =(<i>tb</i> d)
Platform track information (~25 characters):						
3	1?	<i>UIDT</i>	UID type			(<i>tb</i> d; e.g., 1=ICOADS-standard, 2=collection/ <i>SID</i> -specific, 3=platform/voyage-specific)
4	6	<i>UID1</i>	UID of previous report	1	(<i>tb</i> d)	

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
5	6	UID2	UID of this report	1	(tbd)	
6	6	UID3	UID of next report	0	(tbd)	
7	4	ARCT	author reference code— Track	b	b	(alphanumeric)
8	8	CDT	creation date—Track	201401 01	2nnn12 31	ISO-8601, YYYYMMDD (as for CDR, ref. Table C95)
8	1	ASIT	access status indic.— Track	0	1	0=active, 1=inactive

Track attm notes:

Sets aside space for “pointer” fields indicating the UID of the previous (*UID1*) and next (*UID3*) report, with respect to this report (*UID2*), in ship/buoy track sequence (i.e., both forward, and backward, in time and space). If indicated by *UIDT*, this attm could contain collection- (or source ID, *SID*) specific, or even platform/voyage-specific, rather than ICOADS-standard, *UID* information (which thus in a sense can be considered value-added information, if assembled externally).

This could be very useful e.g., for reanalyses to resolve the problem of connecting ship/buoy voyages within ICOADS. Due to effects of dupelim, tracks may consist of records interspersed from a variety of sources, with possibly varying *IDs* for records in track sequence. This proposed attm would provide the storage mechanism for this information, but populating the attm seems likely to be challenging; therefore, as with the *Ivad* attm, ICOADS might consider the *Track* to be metadata and possibly this info could be ingested if somebody else had the resources to implement the ship tracking.

Table CP5. Historical attm (*Hist*) (proposed).

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
1	2	ATTI	attm ID			Note: set <i>ATTI</i> =(tbd)
2	2	ATTL	attm length			Note: set <i>ATTL</i> =(tbd)
Historical data fields (>19 characters):						
3	?	SN	ship's name	u	u	[Note: either the full name, or possibly abbreviated with reference to a separately maintained list, to same space?]
4	5	LCR	longitude by chronometer	0.00	359.99	0.01°E ¹ (ICOADS conv.)
5	5	LMG	longitude made good ²	0.00	359.99	0.01°E ¹ (ICOADS conv.)
6	5	LDR	longitude by account ³	0.00	359.99	0.01°E ¹ (ICOADS conv.)
7	1	WFI	WF indic.	u	u	
8	2	WF	wind force	0	12	
9	1	XWI	XW indic.	u	u	
10	3	XW	wind speed (ext. W)	0	99.9	0.1 m/s
11	1	XDI	XD indic.	u	u	
12	2	XD	wind dir. (ext. D)	u	u	
13	1	SLPI	SLP indic.	u	u	[Note: This or another indicator needed to indicate the presence or absence of SLP adjustment (ref. <i>PB</i>)?]

<u>No.</u>	<u>Len.</u>	<u>Abbr.</u>	<u>Element description</u>	<u>Min.</u>	<u>Max.</u>	<u>Units (Code) [base36]</u>
14	1	TAI	TA indic.	u	u	
15	4	TA	SLP att. thermometer	-99.9	99.9	ref. AT
16	5	SMPR	sympiesometric pressure	25.000	32.000	0.001 inches of mercury ⁴
17	1	XNI	XN indic.	u	u	
18	2	XN	cloud amt. (ext. N)	u	u	
19	1	SGN	significant cloud amount	0	9	(Ns; ref. Table B4)
20	1	SGT	significant cloud type	0	9, "A"	(C; ref. Table B4)
21	2	SGH	significant cloud height	0	99	(hshs; ref. Table B4)
(plus additional elements tbd)						

1. A possible alternative approach for storing these longitudes, such as from the EEIC collection, would be to keep the DDD.MM.SS original format, noting however that original data configurations should be preserved anyway in the *Suppl* attm. Also storing decimal points would violate the standard IMMA representation for numeric data (unless these fields were stored as character strings).

2. With reference to Greenwich Meridian.

3. As calculated by dead reckoning.

4. Due to the erratic nature of the sympiesometer measurements such as observed in the EIC Collection, these values might fall well out of the range specified here.

Preliminary definitions of fields for within the proposed Hist attm (Table CP5):

1) ATTI attm ID

2) ATTL attm length

Each attm begins with *ATTI* and *ATTL*. *ATTI* identifies the attm contents with a numeric identifier (*ATTI*=tbd), and *ATTL* provides the total length of the attm (including *ATTI* and *ATTL*) in bytes (*ATTL*=tbd).

Historical data fields (field numbering preliminary)

3) SN ship's name

4) LCR longitude by chronometer

5) LMG longitude made good

6) LDR longitude by account

7) WFI wind force indicator

8) WF wind force

9) XWI XW indicator

10) XW wind speed (extension field for *W*)

11) XDI XD indicator

12) XD wind direction code (extension field for *D*)

WFI and *WF* are proposed primarily for 0-12 Beaufort wind force codes, but potentially could be extended to other 2- or 1-digit codes, with *WFI* indicating the type of information, e.g.,: 0-6 (half Beaufort code in 19th century Norwegian logbooks), Ben Nevis Observatory code. *XWI* and *XW* are proposed for equivalent wind speed, with *XWI* indicating the scale used to convert from *WF* (e.g., the existing WMO Code 1100 scale or newer alternatives). Similarly, fields *XDI* and *XD* are proposed for older 2- or 1-digit wind direction codes, with *XDI* indicating the type of information, e.g.,: 32-, 16-, or 8-point compasses.

13) SLPI SLP indicator

14) TAI TA indicator

15) TA SLP attached thermometer

SLPI is proposed for historical data to indicate the barometer type (e.g., mercurial, aneroid, or metal). *TAI* (configuration undecided, but probably similar to some of the other temperature indicators) and *TA* are proposed for older mercurial barometer data, in which the attached thermometer is critical for data adjustments.

16) SMPR Sympiesometric pressure

17) XNI XN indicator

18) XNcloud amount (extended field for N)

XN is proposed for historical cloud amount data (e.g., in tenths), with *XNI* indicating the units (e.g., tenths).

19) SGN significant cloud amount

20) SGT significant cloud type

21) SGH significant cloud height

Use of "A" (10 in base36) in place of "/."

Background: These significant cloud fields are listed in Met Office (1948), but appear to have been omitted from regular IMM fields (see Table B4) and the current FM 13 code; in presently available ICOADS data they should always be missing [Note: Since these appear to be strictly historical fields, deletion from this attachment and possible repositioning within Table C5 is suggested for future consideration).]

Hist attm notes:

Fields *SGN*, *SGT*, and *SGH*, which are believed to be purely historical (1960s or earlier), are moved here from the *Immt* attm. Refer to the complete version of the IMMA0 documentation (<http://icoads.noaa.gov/e-doc/imma/R2.5-imma.pdf>) and Table B4. Among potential additional elements: dead reckoning positions (if preserved additionally to observed positions) and surface current movement (derivable from dead reckoning positions), Leeway, magnetic deviation and variation, etc.

Other examples from recent work on the C19th German Maury Collection:

<u>Cloud form:</u>					
Cirrus	CI	Cirrocumulus	CC	Cirrostratus	CS
Alto cumulus	AC	Altostratus	AS		
Stratocumulus	SC	Stratus	ST	Nimbostratus	NS
Cumulus	CU	Cumulonimbus	CB		

Present Weather indicated by combinations of the following Beaufort Codes:

b	blue sky	p	passing showers
c	cloudy sky	q	squally
d	drizzle	r	rain, rainy
f	fog	s	snow
g	gloomy	t	thunder
h	hail	u	ugly threatening sky
l	lightning	v	exceptional visibility
m	mist	w	dew
o	overcast, overcast skies	z	haze

Additional historical fields, such as sea state and sea ice will have to be investigated further to determine the feasibility of incorporating them in IMMA. Historically, these are largely non-standardized recordings, recorded in comments possibly embedded in large amounts of text (e.g., greater than 1500 unique state of sea and weather comments in the EEIC collection).

Document Revision Information

First draft version: 20 May 2016. This report is a major update of <http://coads.noaa.gov/e-doc/imma/R2.5-imma.pdf> and contains information regarding ICOADS Release 3.0 in IMMA1 format, with additional information and clarifications added since the initial draft version.

Second draft version: 16 June 2016. Updates to DCK/SID Tables 6a-c,7 and additional text edits.

Third draft version: 29 June 2016. Updates to DCK Table 6c.
